CHAPTER - 3

If  $A = [a_{ij}]_{m \times n}$ , then its transpose  $A^T$  ( $A^T$ ) =  $[a_{ji}]_{n \times m}$  i.e. if  $A = (2 \ 1)$  then  $A^T = \begin{pmatrix} 1 \\ 2 \end{pmatrix}$ .

Also,  $(A^T)^T = A$ ,  $(kA)^T = kA^T$ ,  $(A+B)^T = A^T + B^T$ ,  $(AB)^T = B^T A^T$ .

- $A$  is symmetric matrix if  $A = A^T$  i.e.  $A^T = A$ .
- $A$  is skew-symmetric if  $A = -A^T$  i.e.  $A^T = -A$ .
- $A$  is any matrix, then  $A = \frac{1}{2} \left\{ (A + A^T) + (A - A^T) \right\}$  = sum of a symmetric and a skew-symmetric matrix.

For eg if  $A = \begin{pmatrix} 2 & 8 \\ 6 & 4 \end{pmatrix}$ , then  $A = \frac{1}{2} \left\{ \begin{pmatrix} 2 & 7 \\ 7 & 4 \end{pmatrix} + \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \right\}$ .

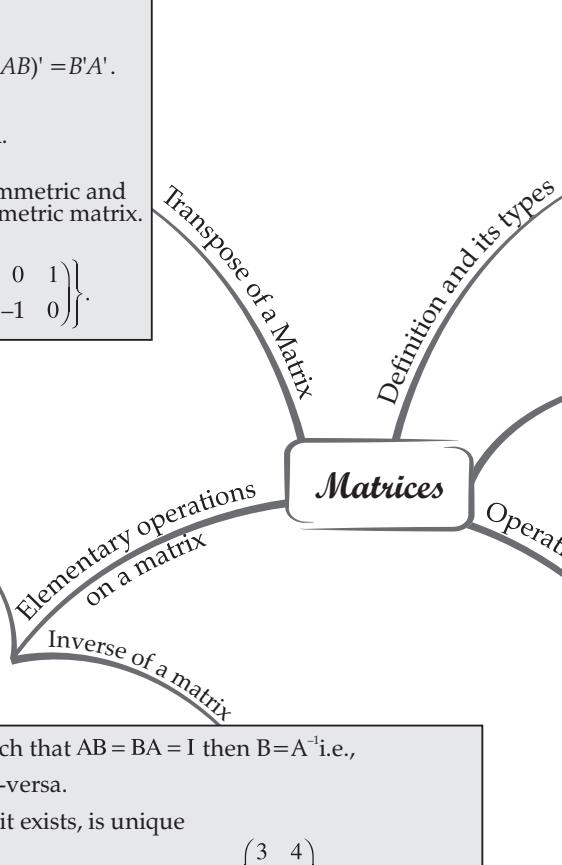

$$\begin{aligned} R_i &\leftrightarrow R_j \text{ or } C_i \leftrightarrow C_j \\ R_i &\rightarrow kR_i \text{ or } C_i \rightarrow kC_i \\ R_i &\rightarrow R_i + kR_j \text{ or } C_i \rightarrow C_i + kC_j \end{aligned}$$

If  $A, B$  are square matrices such that  $AB = BA = I$  then  $B = A^{-1}$  i.e.,  $A$  is the inverse of  $B$  and vice-versa.

Inverse of a square matrix, if it exists, is unique

$$\text{For eg: If } A = \begin{pmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{pmatrix}, \text{ then after } R_1 \leftrightarrow R, A \text{ becomes } \begin{pmatrix} 3 & 4 \\ 1 & 2 \\ 5 & 6 \end{pmatrix}$$

If  $A$  and  $B$  are invertible matrices of the same order, then  $(AB)^{-1} = B^{-1}A^{-1}$ . By elementary transformations, we can convert  $A = IA$  to  $A^{-1}A$ . This is one process of finding the inverse of a given square matrix  $A$ .

A matrix of order  $m \times n$  is an ordered rectangular array of numbers or functions having 'm' rows and 'n' columns. The matrix  $A = [a_{ij}]_{m \times n}$  is given by

$$A = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix}_{m \times n}$$

- Column matrix : It is of the form  $\begin{bmatrix} a_{ij} \end{bmatrix}_{m \times 1}$
- Row matrix : It is of the form  $\begin{bmatrix} a_{ij} \end{bmatrix}_{1 \times n}$
- Square matrix : Here,  $m = n$  (no. of rows = no. of columns)
- Diagonal matrix : All non-diagonal entries are zero i.e.  $a_{ij} = 0 \forall i \neq j$
- Scalar matrix :  $a_{ij} = 0, i \neq j$  and  $a_{ii} = k$  (Scalar),  $i = j$
- Identity matrix :  $a_{ij} = 0, i \neq j$  and  $a_{ii} = 1, i = j$
- Zero matrix : All entries are zero.

Equality of two matrices

$$A = \begin{bmatrix} a_{ij} \end{bmatrix} = \begin{bmatrix} b_{ij} \end{bmatrix} = B \text{ if, } A \text{ and } B \text{ are of same order and } a_{ij} = b_{ij} \forall i \text{ and } j.$$

If  $A, B$  are two matrices of same order, then  $A+B = [a_{ij}+b_{ij}]$ . The addition of  $A$  and  $B$  follows:  $A+B=B+A$ ,  $(A+B)+C=A+(B+C)$ ,  $-A=(-1)A$ ,  $k(A+B)=kA+kB$ ,  $k$  is scalar and  $(k+I)A=kA+IA$ ,  $k$  and  $I$  are constants.

- If  $A = \begin{pmatrix} 2 & 3 \\ 2 & 4 \end{pmatrix}$ ,  $B = \begin{pmatrix} -3 & 2 \\ -4 & 5 \end{pmatrix}$  then  $A+B = \begin{pmatrix} -1 & 5 \\ -2 & 9 \end{pmatrix}$
- If  $A = (2 \ 3)_{1 \times 2}$ ,  $B = \begin{pmatrix} 4 \\ 5 \end{pmatrix}_{2 \times 1}$ , then  $AB = (2 \times 4 + 3 \times 5) = (2 \ 3)_{1 \times 1}$

If  $A = [a_{ij}]_{m \times n}$  and  $B = [b_{jk}]_{n \times p}$ , then  $AB = C = [C_{ik}]_{m \times p}$ ,  $[C_{jk}] = \sum_{i=1}^n a_{ij} b_{jk}$ . Also,  $A(BC) = (AB)C$ ,  $A(B+C) = AB + AC$  and  $(A+B)C = AC + BC$ , but  $AB \neq BA$  (always).
