Two identical uniform rectangular blocks (with longest side L) and a solid sphere of radius R are to be balanced at the edge of a heavy table such that the centre of the sphere remains at the maximum possible horizontal distance from the vertical edge of the table without toppling as indicated in the figure.

If the mass of each block is M and of the sphere is M/2, then the maximum distance x that can be achieved is

$$\frac{M}{2}y - M\left(\frac{L}{2} - y\right) = 0$$

(I) P runs with speed 1 ms⁻¹ towards Q while Q remains stationary

(II) Q runs with speed 1 ms⁻¹ towards P while P remains stationary. Note that irrespective of speed of P, ball always leaves P's hand with speed 2 ms⁻¹ with respect to the ground.

Ignore gravity. Balls will be received by Q

(A) one every 2.5 s in case (I) and one every 3.3 s in case (II)

- (B) one every 2 s in case (I) and one every 4 s in case (II)
- (C) one every 3.3 s in case (I) and one every 2.5 s in case (II)
- (D) one every 2.5 s in case (I) and one every 2.5 s in case (II)

Sol. (I) Let initial distance between P & Q is x

The container is then emptied, dried, and filled with 2 kg of an oil. It is now observed that the same heater raises the temperature of the container-oil system by 2 K in 20 minutes. Assuming no other heat losses in any of the processes, the specific heat capacity of the oil is

(A)
$$2.5 \times 10^{3} \text{ JK}^{-1} \text{ kg}^{-1}$$
 (B) $5.1 \times 10^{3} \text{ JK}^{-1} \text{ kg}^{-1}$ (C) $3.0 \times 10^{3} \text{ JK}^{-1} \text{ kg}^{-1}$ (D) $1.5 \times 10^{3} \text{ JK}^{-1} \text{ kg}^{-1}$
Pt = m_wS_w ΔT + m_cS_c ΔT
10 × 15 × 60 = 0.5 × 4200 × 3 + m_cS_c × 3
9000 = 6300 + m_cS_c3
m_cS_c = 900 J/k.
Now, for oil
10 × 20 × 60 = 2 × S₀ × 2 + 900 × 2
12000 - 1800 = 4 S₀
S₀ = $\frac{10200}{4}$ = 2.51 × 10³ J/kg-k
