(a)
$$Y = 5R(1 - 2\sigma), Y = 2R(1 + \sigma)$$

For $Y = 0$, we get $1 - 2\sigma = 0$, also $1 + \sigma = 0$
 $\Rightarrow \sigma$ lies between $\frac{1}{2}$ and -1 .

(a) Value of Poisson's ratio lie in range of -1 to $\frac{1}{2}$ 122.

123. (b) We know that
$$\frac{dV}{V} = (1+2\sigma)\frac{dL}{L}$$

If
$$\sigma = -\frac{1}{2}$$
 then $\frac{dV}{V} = 0$

i.e. there is no change in volume.

124. (b)
$$\frac{dV}{V} = (1+2\sigma)\frac{dL}{L}$$

 $\frac{dV}{V} = 2 \times 2 \times 10^{-3} = 4 \times 10^{-3} \left[\because \sigma = 0.5 = \frac{1}{2}\right]$
 \therefore Percentage change in volume $= 4 \times 10^{-1} = 0.4\%$

Graphical Questions

$$T = 2\pi \sqrt{\frac{M}{K}} \Rightarrow T^2 \propto M$$

If we draw a graph between T^2 and M then it will be straight line.

and for M = 0, T = 0

i.e. the graph should pass through the origin.

but from the it is not reflected it means the mass of pan was neglected.

(a) In the region *OA*, stress \propto strain *i.e.* Hooke's law hold good.

3. 4. (c)

(c)

9.

(d) As stress is shown on *x*-axis and strain on *y*-axis

we can say that
$$Y = \cot \theta = \frac{1}{\tan \theta} = \frac{1}{\operatorname{slope}}$$

So elasticity of wire *P* is minimum and of wire *R* is maximum

(a) Area of hysterisis loop gives the energy loss in the process of stretching and unstretching of rubber band and this loss will appear in the form of heating.

(d)
$$\frac{Y_A}{Y_B} = \frac{\tan \theta_A}{\tan \theta_B} = \frac{\tan 60}{\tan 30} = \frac{\sqrt{3}}{1/\sqrt{3}} = 3 \Longrightarrow Y_A = 3Y_B$$

8. (a)
$$l = \frac{FL}{AY}$$
 : $l \propto \frac{1}{r^2}$ (*Y*, *L* and *F* are constant)

i.e. for the same load, thickest wire will show minimum elongation. So graph D represent the thickest wire.

(a) From the graph $l = 10^{-4} m$, F = 20N

$$A = 10^{-6} m^2, L = 1m$$

$$\therefore Y = \frac{FL}{Al} = \frac{20 \times 1}{10^{-6} \times 10^{-4}} = 20 \times 10^{10} = 2 \times 10^{11} \, N/m^2$$

10. (b) At point b, yielding of material starts.

 (c) Graph between applied force and extension will be straight line because in elastic range,

Applied force ∞ extension

but the graph between extension and stored elastic energy will be parabolic in nature

As
$$U = 1/2 kx^2$$
 or $U \propto x^2$.

12. (b) $F = -\left(\frac{dU}{dx}\right)$.

In the region BC slope of the graph is positive

- \therefore F = negative *i.e.* force is attractive in nature
- In the region AB slope of the graph is negative
- \therefore *F* = positive *i.e.* force is repulsive in nature

13. (b) Force constant, K = tan 30° =
$$1/\sqrt{3}$$

- 14. (b) In ductile materials, yield point exist while in Brittle material, failure would occur without yielding.
- 15. (d) Young's modulus is defined only in elastic region and

$$Y = \frac{\text{Stress}}{\text{Strain}} = \frac{8 \times 10^{7}}{4 \times 10^{-4}} = 2 \times 10^{11} \ N/m^{2}$$

16. (a) Elasticity of wire decreases at high temperature *i.e.* at higher temperature slope of graph will be less.

So we can say that $T_1 > T_2$

17. (c)

18. (d) Attraction will be minimum when the distance between the molecule is maximum.

Attraction will be maximum at that point where the positive slope is maximum because $F = -\frac{dU}{dx}$

19. (c) $Y = \tan \theta$. According to figure $\theta_A > \theta_B > \theta_C$

i.e.
$$\tan \theta_A > \tan \theta_B > \tan \theta_C$$

or
$$Y_A > Y_B > Y_C$$

 \therefore *A*, *B*, and *C* graph are for steel, brass and rubber respectively.

Assertion and Reason

- (a) Because, the stretching of coil simply changes its shape without any change in the length of the wire used in coil. Due to which shear modulus of elasticity is involved.
- 2. (e) When a spring balance has been used for a long time, the spring in the balance fatigued and there is loss of strength of the spring. In such a case, the extension in the spring is more for a given load and hence the balance gives wrong readings.
- (a) Elasticity is a measure of tendency of the body to regain its original configuration. As steel is deformed less than rubber therefore steel is more elastic than rubber.
- 4. (d) In a glassy solid (*i.e.*, amorphous solid) the various bonds between the atoms or ions or molecules of a solid are not equally strong. Different bonds are broken at different temperatures. Hence there is no sharp melting point for a glassy solid.

5. (a)

7.

8.

9.

10

11.

12.

6. (a) Bulk modulus of elasticity measures how good the body is to regain its original volume on being compressed. Therefore, it represents incompressibility of the material. $K = \frac{-PV}{\Delta V}$ where

P is increase in pressure, ΔV is change in volume.

- (c) Strain is the ratio of change in dimensions of the body to the original dimensions. Because this is a ratio, therefore it is dimensionless quantity.
- (a) A bridge during its use undergoes alternating strains for a large number of times each day, depending upon the movement of vehicles on it when a bridge is used for long time, it losses its elastic strength. Due to which the amount of strain in the bridge for a given stress will become large and ultimately, the bridge may collapse. This may not happen, if the bridges are declared unsafe after long use.
- (d) Ivory is more elastic than wet-clay. Hence the ball of ivory will rise to a greater height. In fact the ball of wet-clay will not rise at all, it will be somewhat flattened permanently.

Answers and Solutions

 $I. (d) F = YA \ \alpha \Delta \theta$

If Y, A and $\Delta \theta$ are constant then $\frac{F_A}{F_B} = \frac{\alpha_A}{\alpha_B} = \frac{3}{2}$

2. (a)
$$Y = \frac{FL}{Al} = \frac{1000 \times 100}{10^{-6} \times 0.1} = 10^{12} N/m^2$$

3. (d) Breaking force = Breaking stress \times Area of cross

section of wire

∴ Breaking force $\propto r$ (Breaking distance is constant) If radius becomes doubled then breaking force will become 4 times *i.e.* 40 × 4 = 160 kg wt

4. (a) Breaking stress depends on the material of wire.

5. (a) Poisson's ratio =
$$\frac{\text{Lateral strain}}{\text{Longitudinal strian}}$$

$$\therefore$$
 Lateral strain = $0.4 \times \frac{0.05}{100}$

So reduced by 0.02%.

6. (a)
$$\frac{dV}{V} = (1+2\sigma)\frac{dL}{dL}$$

if $\sigma = -\frac{1}{2}$ then $\frac{dV}{V} = 0$ i.e. $K = \infty$

7. (d) Breaking force ∞ Area of cross section

If area is double then breaking force will become two times.

8. (b) Breaking force $\propto \pi r^2$

If thickness (radius) of wire is doubled then breaking force will become four times.

9. (c) Tensile strain on each face $= \frac{F}{Y}$

Lateral strain due to the other two forces acting on perpendicular faces = $\frac{-2\sigma F}{Y}$

Total increase in length =
$$(1 - 2\sigma)\frac{F}{V}$$

$$\textbf{0.} \qquad (\textbf{d}) \quad Y = \frac{F}{A} \frac{L}{l} = \frac{F dL^2}{M l}$$

As M = volume \times density $= A \times L \times d$ \therefore $A = \frac{M}{Ld}$

n. (a)
$$l \propto \frac{1}{Y} \Rightarrow \frac{Y_s}{Y_c} = \frac{l_c}{l_s} \Rightarrow \frac{l_c}{l_s} = \frac{2 \times 10^{11}}{1.2 \times 10^{11}} = \frac{5}{3}$$
 ...(i)
Also $l_c - l_s = 0.5$...(ii)

On solving (i) and (ii) $l_c\,=1.25\,\,cm\,$ and $\,l_s\,=0.75\,\,cm$.

12. (b) Compressibility =
$$\frac{\Delta V/V}{P} \Rightarrow \sigma = \frac{\Delta V}{PV} \Rightarrow \Delta V = \sigma PV$$

13. (d)
$$\eta = \frac{F/A}{x/L} \Rightarrow x = \frac{L}{\eta} \times \frac{F}{A}$$

If η and F are constant then $x \propto \frac{L}{A}$

For maximum displacement area at which force applied should be minimum and vertical side should be maximum, this is given in the R position of rectangular block.
