Ans:	<p>I. Single row function : Length() (any single row function) Aggregate Function : Max() (any other aggregate function)</p> <p>A single row functions works on every row of the table and hence gives output for each row in the table. An Aggregate function also known as Multiple row function works on a group of rows and returns only 1 output.</p> <p><i>(1 Mark for the writing any 1 valid Single row and Aggregate function)</i> <i>(1 Mark for writing the difference in their working)</i></p> <p>II. Aggregate functions ignore NULL values. The first query counts the Not Null values in the column ENAME hence the output is 5.</p> <p>But the second query counts all the records present in the table EMP which gives the output as 8.</p> <p>Hence this implies that there are 8 rows in the table and the Ename column contains the name of only 5 employees. <math>8-5 = 3</math>, i.e. 3 names have been left blank. This means that there are 3 null values in the column ENAME.</p> <p><i>(1 Mark for giving individual explanation of the queries)</i></p>
