

Square root of Complex Number

Q.1. Find the square root of $5 - 12i$.

Solution : 1

Let $\sqrt{5 - 12i} = x + iy$

Squaring both sides, we get

$$5 - 12i = x^2 + 2ixy + (iy)^2 = x^2 - y^2 + 2xyi.$$

Equating real and imaginary parts , we get

$$5 = x^2 - y^2 \text{ ----- (1) \& } xy = -6 \text{ ----- (2)}$$

Squaring (1), we get

$$25 = (x^2 - y^2)^2 = (x^2 + y^2)^2 - 4x^2y^2$$

$$\text{Or, } 25 = (x^2 + y^2)^2 - 4(-6)^2$$

$$\text{Or, } (x^2 + y^2)^2 = 169$$

$$\text{Or, } x^2 + y^2 = 13 \text{ ----- (3)}$$

Adding (1) and (3) we get

$$2x^2 = 18 \Rightarrow x = \pm 3.$$

Subtracting (1) from (3) we get

$$2y^2 = 8 \Rightarrow y = \pm 2.$$

Therefore, $\sqrt{5 - 12i} = 3 + 2i$ or, $3 - 2i$ or, $-3 + 2i$ or, $-3 - 2i$.

As imaginary part of $5 - 12i$ is negative, the square root is $\pm(3 - 2i)$.

Q.2. Find the square root of : $-15 - 8i$.

Solution : 2

Let $\sqrt{-15 - 8i} = x + iy$.

Squaring both sides, we get

$$-15 - 8i = (x + iy)^2 = x^2 - y^2 + 2ixy$$

Equating real and imaginary parts, we get

$$-15 = x^2 - y^2 \text{ ----- (1)}$$

$$\text{And } -4 = xy \text{ ----- (2)}$$

Squaring (1), we get

$$225 = (x^2 - y^2)^2 = (x^2 + y^2)^2 - 4x^2y^2$$

$$\text{Or, } 225 = (x^2 + y^2)^2 - 4(-4)^2$$

$$\text{Or, } (x^2 + y^2)^2 = 289$$

$$\text{Or, } x^2 + y^2 = 17 \text{ ----- (3)}$$

Adding (1) and (3), we get

$$2x^2 = 2 \Rightarrow x^2 = 1 \Rightarrow x = \pm 1.$$

Subtracting (1) from (3), we get

$$2y^2 = 32 \Rightarrow y^2 = 16 \Rightarrow y = \pm 4.$$

Therefore, $\sqrt{-15 - 8i} = 1 + 4i$ or, $1 - 4i$, $-1 + 4i$, $-1 - 4i$.

As imaginary part of $-15 - 8i$ is negative, the square root is $\pm (1 - 4i)$.

Q.3. Find the square root of i .

Solution : 3

Let $\sqrt{i} = x + iy$.

Squaring, we get

$$i = (x + iy)^2 = x^2 - y^2 + 2xyi$$

Equating real and imaginary parts, we get

$$x^2 - y^2 = 0 \text{ ----- (1)}$$

$$2xy = 1 \text{ ----- (2)}$$

Squaring (1), we get

$$(x^2 - y^2)^2 = 0$$

$$\text{Or, } (x^2 + y^2)^2 - 4x^2y^2 = 0$$

$$\text{Or, } (x^2 + y^2)^2 = 4x^2y^2 = (2xy)^2 = (1)^2 = 1$$

$$\text{Or, } x^2 + y^2 = 1 \text{ ----- (3)}$$

Solving (1) and (3) we get $x = \pm 1/\sqrt{2}$ and $y = \pm 1/\sqrt{2}$.

As imaginary part of i is positive, the square root is $\pm (1/\sqrt{2} + 1/\sqrt{2})$

$$= \pm 1/\sqrt{2} (1 + i).$$
