

# Constructions

## I. Construction of tangent using the centre of the circle:

### Example :

Draw a tangent to a circle of radius 4.8 cm by using the centre of the circle.

### Solution:

**Step 1:** Draw a circle with centre O having radius 4.8 cm.

**Step 2:** Take a point Q on the circle and draw a ray OQ.

**Step 3:** Draw a line  $l$  perpendicular to OQ at point Q.

Line  $l$  is the required tangent.

## II. Construction of tangent without using the centre of the circle:

**Example:**

Draw a circle of radius 6.2 cm and take a point A on it. Draw a tangent through point A without using the centre.

**Solution:**

**Step 1:** Draw the circle of radius 6.2 cm, take point A anywhere on it and draw a chord AB of any length.

**Step 2:** Take a point C anywhere on the alternate arc of ADB and join C to A and B.

**Step 3:** Draw a ray AP such that  $\angle BAP = \angle BCA$ .

Line containing ray AP is the required tangent.

- **Construction of tangents to a circle**

**Example:**

Draw a circle of radius 3 cm. From a point 5 cm away from its centre, construct a pair of tangents to the circle and measure their lengths.

**Solution:**

Steps of construction:

1. Draw a circle with centre O and radius 3 cm. Take a point P such that  $OP = 5$  cm, and then join OP.
2. Draw the perpendicular bisector of OP. Let M be the mid point of OP.
3. With M as the centre and OM as the radius, draw a circle. Let it intersect the previously drawn circle at A and B.
4. Join PA and PB. Therefore, PA and PB are the required tangents. It can be observed that  $PA = PB = 4$  cm.

- **Construction of circumcircle of given triangle:**

**Example:**

Construct the circumcircle of  $\triangle PQR$  such that  $\angle Q = 60^\circ$ ,  $QR = 4$  cm, and  $QP = 5.7$  cm.

**Solution:**

**Step 1:** Draw a triangle PQR with  $\angle Q = 60^\circ$ ,  $QR = 4$  cm, and  $QP = 5.7$  cm

**Step 2:** Draw perpendicular bisector of any two sides, say QR and PR. Let these perpendicular bisectors meet at point O.

**Step 3:** With O as centre and radius equal to OP, draw a circle.

The circle so drawn passes through the points P, Q, and R, and is the required circumcircle of  $\Delta PQR$ .

- **Construction of incircle of given triangle:**

**Example:**

Construct incircle of a right  $\Delta PQR$ , right angled at Q, such that  $QR = 4$  cm and  $PR = 6$  cm.

**Solution:**

**Step 1:** Draw a  $\Delta PQR$  right-angled at Q with  $QR = 4$  cm and  $PR = 6$  cm.

**Step 2:** Draw bisectors of  $\angle Q$  and  $\angle R$ . Let these bisectors meet at the point O.

**Step 3:** From O, draw OX perpendicular to the side QR.

**Step 4:** With O as centre and radius equal to OX, draw a circle.

The circle so drawn touches all the sides of  $\Delta PQR$  and is the required incircle of  $\Delta PQR$ .

- **Construction of circumcircle of a regular hexagon:**

Following are the steps of construction of circumcircle of a regular hexagon ABCDEF.

**Step 1:** Construct a regular hexagon of side  $x$  unit.

**Step 2:** Draw perpendicular bisectors of sides AB and BC. Let them intersect at a point O.

**Step 3:** With O as centre and radius equal to OA, draw a circle.

This circle touches all the vertices A, B, C, D, E, and F of the regular hexagon ABCDEF. Hence, it is the required circumcircle of the regular hexagon.

- **Construction of incircle of a regular hexagon:**

Following are the steps of construction of incircle of a regular hexagon ABCDEF.

**Step 1:** Construct a regular hexagon of side  $x$  unit.

**Step 1:** Draw the bisectors of  $\angle B$  and  $\angle C$ . Let them meet at point I.

**Step 2:** From I, draw IN perpendicular to BC.

**Step 3:** Taking I as centre and radius equal to IN, draw a circle.

This circle touches each side of regular hexagon  $ABCDEF$ . Hence, it is the required incircle.
