

Short Answer Type Questions – II

[3 marks]

Que 1. In Fig. 7.11, $DE \parallel BC$. If $AD = x$, $DB = x - 2$, $AE = x + 2$ and $EC = x - 1$, find the value of x .

Fig. 7.11

Sol. In $\triangle ABC$, we have
 $DE \parallel BC$.

$$\therefore \frac{AD}{DB} = \frac{AE}{EC} \quad [\text{By Basic Proportionality Theorem}]$$

$$\Rightarrow \frac{x}{x-2} = \frac{x+2}{x-1} \quad \Rightarrow x(x-1) = (x-2)(x+2)$$

$$\Rightarrow x^2 - x = x^2 - 4 \quad \Rightarrow x = 4$$

Que 2. E and F are points on the sides PQ and PR respectively of a $\triangle PQR$. Show that $EF \parallel QR$. If $PQ = 1.28$ cm, $PR = 2.56$ cm, $PE = 0.18$ cm and $PF = 0.36$ cm.

Fig. 7.12

Sol. We have, $PQ = 1.28$, $PR = 2.56$ cm
 $PE = 0.18$ cm, $PF = 0.36$ cm

Now, $EQ = PQ - PE = 1.28 - 0.18 = 1.10$ cm

And $FR = PR - PF = 2.56 - 0.36 = 2.20$ cm

Now,
$$\frac{PE}{EQ} = \frac{0.18}{1.10} = \frac{18}{110} = \frac{9}{55}$$

And,
$$\frac{PF}{FR} = \frac{0.36}{2.20} = \frac{36}{220} = \frac{9}{55} \quad \therefore \frac{PE}{EQ} = \frac{PF}{FR}$$

Therefore, $EF \parallel QR$ [By the converse of basic proportionality Theorem]

Que 3. A vertical pole of length 6 m casts a shadow 4 m long on the ground and at the same time a tower casts a shadow 28 m long. Find the height of the tower.

Sol. Let AB be a vertical pole of length 6 m and BC be its shadow and DE be tower and EF be its shadow.

Join AC and DF.

Fig. 7.13

Now, in $\triangle ABC$ and $\triangle DEF$, we have

$$\angle B = \angle E = 90^\circ$$

$$\angle C = \angle F \quad (\text{Angle of elevation of the sun})$$

$$\therefore \triangle ABC \sim \triangle DEF \quad (\text{By AA criterion of similarity})$$

$$\text{Thus, } \frac{AB}{DE} = \frac{BC}{EF}$$

$$\Rightarrow \frac{6}{h} = \frac{4}{28} \quad (\text{Let } DE = h)$$

$$\Rightarrow \frac{6}{h} = \frac{1}{7} \quad \Rightarrow \quad h = 42$$

Hence, height of tower, $DE = 42$ m

Que 4. In Fig. 7.14, if $LM \parallel CB$ and $LN \parallel CD$, prove that $\frac{AM}{AB} = \frac{AN}{AD}$.

Fig. 7.14

Sol. Firstly, in $\triangle ABC$, we have

$$LM \parallel CB \quad (\text{Given})$$

Therefore, by Basic proportionality Theorem, we have

$$\frac{AM}{AB} = \frac{AL}{AC} \quad \dots(i)$$

Again, in $\triangle ACD$, we have

$$LN \parallel CD \quad (\text{Given})$$

$\therefore$ By Basic proportionality Theorem, we have

$$\frac{AN}{AD} = \frac{AL}{AC} \quad \dots(ii)$$

Now, from (i) and (ii), we have $\frac{AM}{AB} = \frac{AN}{AD}$.

Que 5. In Fig. 7.15, $DE \parallel OQ$ and $DF \parallel OR$, Show that $EF \parallel QR$.

Fig. 7.15

Sol. In $\triangle POQ$, we have

$$DE \parallel OQ \quad (\text{Given})$$

$\therefore$ By Basic proportionality Theorem, we have

$$\frac{PE}{EQ} = \frac{PD}{DO} \quad \dots(i)$$

Similarly, in $\triangle POR$, we have

$$DF \parallel OR \quad (\text{Given})$$

$$\therefore \frac{PD}{DO} = \frac{PF}{FR} \quad \dots(ii)$$

Now, from (i) and (ii), we have

$$\frac{PE}{EQ} = \frac{PF}{FR} \Rightarrow EF \parallel QR$$

[Applying the converse of Basic proportionality Theorem in ΔPQR]

Que 6. Using converse of Basic proportionality Theorem, prove that the line joining the mid-points of any two sides of a triangle is parallel to the third side.

Fig. 7.16

Sol. Given: ΔABC in which D and E are the mid-points of sides AB and AC respectively.

To prove: $DE \parallel BC$

Proof: Since, D and E are the mid-points of AB and AC respectively

$$\therefore AD = DB \quad \text{and} \quad AE = EC$$

$$\Rightarrow \frac{AD}{DB} = 1 \quad \text{and} \quad \frac{AE}{EC} = 1$$

$$\Rightarrow \frac{AD}{DB} = \frac{AE}{EC}$$

Therefore, $DE \parallel BC$ (By the converse of Basic proportionality Theorem)

Que 7. State which pairs of triangles in the following figures are similar. Write the similarity criterion used by you for answering the question and also write the pairs of similar triangles in the symbolic form.

Fig. 7.17

Sol. (i) In ΔABC and ΔPQR , we have

$$\frac{AB}{QR} = \frac{2}{4} = \frac{1}{2}, \quad \frac{AC}{PQ} = \frac{3}{6} = \frac{1}{2}$$

Hence,
$$\frac{AB}{QR} = \frac{AC}{PQ} = \frac{BC}{PR}$$

$\therefore \triangle ABC \sim \triangle QRP$ by SSS criterion of similarity.

(ii) In $\triangle LMP$ and $\triangle FED$, we have

$$\frac{LP}{DF} = \frac{3}{6} = \frac{1}{2}, \quad \frac{MP}{DE} = \frac{2}{4} = \frac{1}{2}, \quad \frac{LM}{EF} = \frac{27}{5}$$

Hence,
$$\frac{LP}{DF} = \frac{MP}{DE} \neq \frac{LM}{EF}$$

$\therefore \triangle LMP$ is not similar to $\triangle FED$.

(iii) In $\triangle NML$ and $\triangle PQR$, we have

$$\angle M = \angle Q = 70^\circ$$

Now,
$$\frac{MN}{PQ} = \frac{2.5}{6} = \frac{5}{12} \quad \text{and} \quad \frac{ML}{QR} = \frac{5}{10} = \frac{1}{2}$$

Hence
$$\frac{MN}{PQ} \neq \frac{ML}{QR}$$

$\therefore \triangle NML$ is not similar to $\triangle PQR$.

Que 8. In Fig. 7.18, $\frac{AO}{OC} = \frac{BO}{OD} = \frac{1}{2}$ and $AB = 5$ cm. Find the value of DC .

Fig. 7.18

Sol. In $\triangle AOB$ and $\triangle COD$, we have

$$\angle AOB = \angle COD \quad [\text{Vertically opposite angles}]$$

$$\frac{AO}{OC} = \frac{BO}{OD} \quad [\text{Given}]$$

So, by SAS criterion of similarity, we have

$$\triangle AOB \sim \triangle COD$$

$$\Rightarrow \frac{AO}{OC} = \frac{BO}{OD} = \frac{AB}{DC} \quad \Rightarrow \frac{1}{2} = \frac{5}{DC} \quad [\because AB = 5 \text{ cm}]$$

$$\Rightarrow DC = 10 \text{ cm}$$

Que 9. E is a point on the side AD produced of a parallelogram ABCD and BE intersects CD at F. Show that $\triangle ABE \sim \triangle CFB$.

Fig. 7.19

Sol. In $\triangle ABE$ and $\triangle CFB$, we have

$$\angle AEB = \angle CBF \quad (\text{Alternate angles})$$

$$\angle A = \angle C \quad (\text{Opposite angles of a parallelogram})$$

$$\therefore \triangle ABE \sim \triangle CFB \quad (\text{By AA criterion of similarity})$$

Que 10. S and T are points on sides PR and QR of $\triangle PQR$ such that $\angle P = \angle RTS$. Show that $\triangle RPQ \sim \triangle RTS$.

Fig. 7.20

Sol. In $\triangle RPQ$ and $\triangle RTS$, we have

$$\angle RPQ = \angle RTS \quad (\text{Given})$$

$$\angle PRQ = \angle TRS = \angle R \quad (\text{Common})$$

$$\therefore \triangle RPQ \sim \triangle RTS \quad (\text{By AA criterion of similarity})$$

Que 11. In Fig. 7.21, ABC and AMP are two right triangles right-angled at B and M respectively. Prove that:

$$(i) \triangle ABC \sim \triangle AMP \quad (ii) \frac{CA}{PA} = \frac{BC}{MP}$$

Fig. 7.21

Sol. (i) In ΔABC and ΔAMP , we have

$$\angle ABC = \angle AMP = 90^\circ \quad (\text{Given})$$

And, $\angle BAC = \angle MAP$ (Common angle)

$\therefore \Delta ABC \sim \Delta AMP$ (By AA criterion of similarity)

(ii) As $\Delta ABC \sim \Delta AMP$ (Proved above)

$$\therefore \frac{CA}{PA} = \frac{BC}{MP} \quad (\text{Sides of similar triangles are proportional})$$

Que 12. D is a point on the side BC of a triangle ABC such that $\angle ADC = \angle BAC$. Show that $CA^2 = CB \cdot CD$.

Fig. 7.22

Sol. In ΔABC and ΔDAC , we have

$$\angle BAC = \angle ADC \quad (\text{Given})$$

and $\angle C = \angle C$ (Common)

$\therefore \Delta ABC \sim \Delta DAC$ (By AA criterion of similarity)

$$\Rightarrow \frac{AB}{DA} = \frac{BC}{AC} = \frac{AC}{DC}$$

$$\Rightarrow \frac{CB}{CA} = \frac{CA}{CD} \Rightarrow CA^2 = CB \times CD$$

Que 13. ABC is an equilateral triangle of side 2a. Find each of its altitudes.

Fig. 7.23

Sol. Let ABC be an equilateral triangle of side $2a$ units.
We draw $AD \perp BC$. Then D is the mid-point of BC.

$$\Rightarrow BD = \frac{BC}{2} = \frac{2a}{2} = a$$

Now, ABD is a right triangle right-angled at D.

$$\therefore AB^2 = AD^2 + BD^2 \quad [\text{By Pythagoras Theorem}]$$

$$\Rightarrow (2a)^2 = AD^2 + a^2$$

$$\Rightarrow AD^2 = 4a^2 - a^2 = 3a^2 \quad \Rightarrow AD = \sqrt{3}a$$

Hence, each altitude = $\sqrt{3}a$ unit.

Que 14. An aeroplane leaves an airport and flies due north at a speed of 1000 km per hour. At the same time, another aeroplane leaves the same airport and flies due west at a speed of 1200 km per hour. How far apart will be the two planes after $1\frac{1}{2}$ hours?

Fig. 7.24

Sol. Let the first aeroplane starts from O and goes upto A towards north where

$$OA = \left(1000 \times \frac{3}{2}\right) \text{ km} = 1500 \text{ km}$$

(Distance = Speed $\times$ Time)

Again let second aeroplane starts from O at the same time and goes upto B towards west where

$$OB = 1200 \times \frac{3}{2} = 1800 \text{ km}$$

Now, we have to find AB.

In right angled ΔABO , we have

$$AB^2 = OA^2 + OB^2 \quad [\text{By using Pythagoras Theorem}]$$

$$\Rightarrow AB^2 = (1500)^2 + (1800)^2$$

$$\Rightarrow AB^2 = 2250000 + 3240000 \Rightarrow AB^2 = 5490000$$

$$\therefore AB = 100\sqrt{549} = 100 \times 23.4307 = 2343.07 \text{ km.}$$

Que 15. In the given Fig. 7.25, ΔABC and ΔDBC are on the same base BC. If AD intersects BC at O. prove that $\frac{\text{ar}(\Delta ABC)}{\text{ar}(\Delta DBC)} = \frac{AO}{DO}$.

Sol. Given: ΔABC and ΔDBC are on the same base BC and AD intersects BC at O.

To Prove: $\frac{\text{ar}(\Delta ABC)}{\text{ar}(\Delta DBC)} = \frac{AO}{DO}$

Construction: Draw $AL \perp BC$ and $DM \perp BC$

Proof: In ΔALO and ΔDMO , we have

$$\angle ALO = \angle DMO = 90^\circ \text{ and}$$

$$\angle AOL = \angle DOM \quad (\text{Vertically opposite angles})$$

$$\therefore \Delta ALO \sim \Delta DMO \quad (\text{By AA-Similarity})$$

$$\Rightarrow \frac{AL}{DM} = \frac{AO}{DO} \quad \dots(i)$$

$$\therefore \frac{\text{ar}(\Delta ABC)}{\text{ar}(\Delta DBC)} = \frac{\frac{1}{2}BC \times AL}{\frac{1}{2}BC \times DM} = \frac{AL}{DM} = \frac{AO}{DO} \quad (\text{Using (i)})$$

$$\text{Hence, } \frac{\text{ar}(\Delta ABC)}{\text{ar}(\Delta DBC)} = \frac{AO}{DO}$$

Que 16. In Fig. 7.26, $AB \parallel PQ \parallel CD$, $AB = x$ units, $CD = y$ units and $PQ = z$ units.

Prove that $\frac{1}{x} + \frac{1}{y} = \frac{1}{z}$.

Fig. 7.26

Sol. In $\triangle ADB$ and $\triangle PDQ$,

Since $AB \parallel PQ$

$$\angle ABQ = \angle PQD$$

(Corresponding $\angle$'s)

$$\angle ADB = \angle PDQ$$

(Common)

By AA-Similarity

$$\triangle ADB \sim \triangle PDQ$$

$$\therefore \frac{DQ}{DB} = \frac{PQ}{AB} \Rightarrow \frac{DQ}{DB} = \frac{z}{x} \quad \dots(i)$$

Similarly, $\triangle PBQ \sim \triangle CBD$

$$\text{And} \quad \frac{BQ}{DB} = \frac{z}{x} \quad \dots(ii)$$

Adding (i) and (i), we get

$$\frac{z}{x} + \frac{z}{y} = \frac{DQ+BQ}{DB} = \frac{BD}{BD}$$

$$\frac{z}{x} + \frac{z}{y} = 1 \Rightarrow \frac{1}{x} + \frac{1}{y} + \frac{1}{z}$$

Que 17. In Fig. 7.27, if $\triangle ABC \sim \triangle DEF$ and their sides are of length (in cm) as marked along them, then find the length of the sides of each triangle.

Fig. 7.27

Sol. $\triangle ABC \sim \triangle DEF$ (Given)

Therefore, $\frac{AB}{DE} = \frac{BC}{EF} = \frac{CA}{FD}$

So, $\frac{2x-1}{18} = \frac{2x+2}{3x+9} = \frac{3x}{6x}$

Now, taking $\frac{2x-1}{18} = \frac{1}{2}$

$\Rightarrow 4x - 2 = 18 \Rightarrow x = 5$

$\therefore AB = 2 \times 5 - 1 = 9, BC = 2 \times 5 + 2 = 12$

$CA = 3 \times 5 = 15, DE = 18, EF = 3 \times 5 + 9 = 24 \text{ and } FD = 6 \times 5 = 30$

Hence, $AB = 9 \text{ cm}, BC = 12 \text{ cm}, CA = 15 \text{ cm}$
 $DE = 18 \text{ cm}, EF = 24 \text{ cm}, FD = 30 \text{ cm}$

Que 18. In $\triangle ABC$, it is given that $\frac{AB}{AC} = \frac{BD}{DC}$. If $\angle B = 70^\circ$ and $\angle C = 50^\circ$ then find $\angle BAD$.

Fig. 7.28

Sol. In $\triangle ABC$

$\therefore \angle A + \angle B + \angle C = 180^\circ$ (Angle sum property)

$\angle A + 70^\circ + 50^\circ = 180^\circ$

$\Rightarrow \angle A = 180^\circ - 120^\circ \Rightarrow \angle A = 60^\circ$

$\therefore \frac{AB}{AC} = \frac{BD}{DC}$ (Given)

$\therefore \angle 1 = \angle 2$ (i)

[Because a line through one vertex of a triangle divides the opposite sides in the ratio of other two sides, then the line bisects the angle at the vertex.]

But $\angle 1 + \angle 2 = 60^\circ$ (ii)

From (i) and (ii) we get,

$2\angle 1 = 60^\circ \Rightarrow \angle 1 = \frac{60^\circ}{2} = 30^\circ$

Hence, $\angle BAD = 30^\circ$

Que 19. If the diagonals of a quadrilateral divides each other proportionally, prove that it is a trapezium.

Fig. 7.29

Sol. $\frac{AO}{BO} = \frac{CO}{DO}$ (Given)

$\Rightarrow \frac{AO}{CO} = \frac{BO}{DO}$... (i)

In $\triangle ABD$, $EQ \parallel AB$ (Construction)

$\therefore \frac{AE}{ED} = \frac{BO}{DO}$ (By BPT) ... (ii)

From equations (i) and (ii)

$\frac{AE}{ED} = \frac{AO}{CO} \Rightarrow EO \parallel DC$ (Converse of BPT)

But $EO \parallel AB$ (Construction)

$\therefore AB \parallel DC$

$\Rightarrow$ In quad ABCDD $AB \parallel DC \Rightarrow ABCD$ is a trapezium.

Que 20. In the given Fig. 7.30, $\frac{PS}{SQ} = \frac{PT}{TR}$ and $\angle PST = \angle PRQ$. Prove that PQR is an isosceles triangle.

Fig. 7.30

Sol. Given: $\frac{PS}{SQ} = \frac{PT}{TR}$ and $\angle PST = \angle PRQ$

To Prove: PQR is isosceles triangle.

Proof: $\frac{PS}{SQ} = \frac{PT}{TR}$

By converse of BPT we get

$$ST \parallel QR$$

$$\therefore \angle PST = \angle PQR \quad (\text{Corresponding angles}) \quad \dots(i)$$

$$\text{But, } \angle PST = \angle PRQ \quad (\text{Given}) \quad \dots(ii)$$

From equation (i) and (ii)

$$\angle PQR = \angle PRQ \Rightarrow PR = PQ$$

So, ΔPQR is an isosceles triangle.

Que 21. The diagonals of a trapezium ABCD in which $AB \parallel DC$, intersect at O. If $AB = 2$ cd then find the ratio of areas of triangles AOB and COD.

Fig. 7.31

Sol. In ΔAOB and ΔCOD

$$\angle COD = \angle AOB \quad (\text{Vertically opposite angles})$$

$$\angle CAB = \angle DCA \quad (\text{Alternate angles})$$

$$\therefore \Delta AOB \sim \Delta COD \quad (\text{B AA-similarity})$$

By area of theorem

$$\frac{\text{ar}(\Delta AOB)}{\text{ar}(\Delta COD)} = \frac{AB^2}{DC^2} \Rightarrow \frac{\text{ar}(\Delta AOB)}{\text{ar}(\Delta COD)} = \frac{(2CD)^2}{CD^2} = \frac{4}{1}$$

Hence, $\text{ar}(\Delta AOB) : \text{ar}(\Delta COD) = 4 : 1$.

Que 22. In the given Fig. 7.32, find the value of x in terms of a, b and c.

Fig. 7.32

Sol. In ΔLMK and ΔPNK

$$\begin{aligned} \text{We have, } \angle M = \angle N = 50^\circ \quad \text{and} \quad \angle K &= \angle K \quad (\text{Common}) \\ \Delta LMK &\sim \Delta PNK \quad (\text{AA - Similarity}) \end{aligned}$$

$$\frac{LM}{PN} = \frac{KM}{KN}$$

$$\frac{a}{x} = \frac{b+c}{c} \Rightarrow x = \frac{ac}{b+c}$$

Que 23. In the given Fig. 7.33, $CD \parallel LA$ and $DE \parallel AC$. Find the length of CL if $BE = 4$ cm and $EC = 2$ cm.

Fig. 7.33

Sol. In $\triangle ABC$, $DE \parallel AC$ (Given)

$$\Rightarrow \frac{BD}{DA} = \frac{BE}{EC} \quad (\text{By BPT}) \quad \dots(i)$$

In $\triangle ABL$ $DC \parallel AL$

$$\Rightarrow \frac{BD}{Da} = \frac{BC}{CL} \quad (\text{By BPT}) \quad \dots(ii)$$

From (i) and (ii) we get

$$\frac{BE}{EC} = \frac{BC}{CL} \Rightarrow \frac{4}{2} = \frac{6}{CL} \Rightarrow CL = 3 \text{ cm}$$

Que 24. In the given Fig. 7.34, $AB = AC$. E is a point on CB produced. If AD is perpendicular to BC and EF perpendicular to AC , prove that $\triangle ABD$ is similar to $\triangle CEF$.

Fig. 7.34

Sol. In $\triangle ABD$ and $\triangle CEF$

$$AB = AC \quad (\text{Given})$$

$$\Rightarrow \angle ABC = \angle ACB \quad (\text{Equal sides have equal opposite angles})$$

$$\angle ABD = \angle ECF$$

$$\angle ADB = \angle EFC$$

(Each 90°)

$$\text{So, } \triangle ABD \sim \triangle CEF$$

(AA – Similarity)
