Chapter 1 Chemical Reactions and Equations

Very Short Answer Type Questions [1 Mark]

Q. State one basic difference between a physical change and a chemical change.

Answer. In physical change, no new substance is formed, whereas in a chemical change, new substance(s) is/are formed.

Q. What is meant by a chemical reaction?

Answer. The reaction representing a chemical change is called a chemical reaction.

35.AgN0₃(aq) + NaCl(aq)———— > AgCl(s)₄
$$\downarrow$$
 + NaN0₃(aq) FeS + H₂S0₄——— > FeS0₄ + H₂S↑

Consider the above mentioned two chemical equations with two different kinds of arrows (\uparrow and \downarrow) along with product. What do these two different arrows indicate? Ans, \uparrow shows the gas is evolved whereas \downarrow shows insoluble substance (precipitate) is formed.

Q. Hydrogen being a highly inflammable gas and oxygen being a supporter of combustion, yet water which is a compound made up of hydrogen and oxygen is used to extinguish fire. Why?

Answer. It is because properties of compound (H_2O) are different from properties of its constituting elements, i.e. H_2 and O_2 .

Q. What happens chemically when quicklime is added to water filled in a bucket?

Answer. Quicklime reacts with water to form slaked lime and produces lot of heat and hissing sound.

$${}^{\cdot}\text{CaO}(s) + \text{H}_2\text{O}(l) \longrightarrow \text{Ca}(\text{OH})_2(s) + \text{heat} + \text{hissing sound}$$
Quicklime Water Slaked lime
(Calcium oxide) (Calcium hydroxide)

Q. On what basis is a chemical equation balanced?

Answer. A chemical reaction is balanced on the basis of law of conservation of mass.

Q. What change in colour is observed when white silver chloride is left exposed to sunlight? State the type of chemical reaction in this change.

Answer. Silver chloride becomes grey. It is a photochemical decomposition reaction.

Q. Write a balanced chemical equation for the reaction between sodium chloride and silver nitrate indicating the physical state of the reactants and the products.

Answer.

$$AgNO_3(aq) + NaCl(aq) \longrightarrow AgCl(s) + NaNO_3(aq)$$

.

Q. In electrolysis of water, why is the volume of gas collected over one electrode double that of gas collected over the other electrode?

Answer. It is because water contains hydrogen and oxygen in the ratio of 2:1.

Q. Balance the following chemical equations.

Answer.

$$\begin{array}{c} \text{Pb(NO}_3)_2 \longrightarrow \text{PbO} + \text{NO}_2 + \text{O}_2 \\ \\ 2\text{Pb(NO}_3)_2 \longrightarrow 2\text{PbO} + 4\text{NO}_2 + \text{O}_2 \end{array}$$

Short Answer Type Questions [2 Marks]

Q."We need to balance a skeltal chemical equation." Give reason to justify the statement.

Answer. Skeltal chemical equation are unbalanced. We need to balance chemical equation because of law of conservation of mass. It states that 'matter can neither be created nor be destroyed'. Therefore chemical equation must be balanced in each and every chemical reaction.

Q. Giving an example list two information which make a chemical equation more useful (informative).

Answer.

(i) Physical state of reactants must be mentioned, e.g.

$$2H_2(g) + O_2(g) --- > 2H_2O(I)$$

(ii) Condition in which reaction takes place are written on the arrow head, e.g.

$$2H_9(g) + O_2(g) \xrightarrow{\text{burning}} 2H_2O(l)$$

Consider the following chemical reaction

X + Barium chloride——-> Y + Sodium chloride

(White ppt)

- (a) Identify 'X' and 'Y'
- (b) The type of reaction
- (a) X' is Na2SO₄ and Y is BaSO₄.
- (b) The type of reaction

(White ppt)

The reaction is precipitation reaction. It is also called double displacement reaction.

Q. Name the reducing agent in the following reaction:

$$3MnO_2 + 4Al ---- > 3Mn + 2Al_2O_3$$

State which is more reactive, Mn or A1 and why?

Answer. 'Al' is reducing agent.

'AT is more reactive than Mn v 'AI' displaces Mn from its oxide.

Q. (i) Write a balanced chemical equation for process of photosynthesis.

(ii) When do desert plants take up carbon dioxide and perform photosynthesis?

(i)
$$6CO_2(g) + 6H_2O(l) \xrightarrow{Sunlight} C_6H_{12}O_6(s) + 6O_2(g)$$

- (ii) In desert plants the stomata are open at night. They take CO_2 at night and is stored in the form of acid and is used during day time for photosynthesis.
- Q. What is observed when a solution of potassium iodide solution is added to a solution of lead nitrate? Name the type of reaction. Write a balanced chemical equation to represent the above chemical reaction.

Answer. Yellow precipitate of lead iodide is formed. It is precipitation reaction. Pb(NO_3)₂ (aq) + 2KI (aq) —-> Pbl₂ (s) + 2KNO₃ (aq) It is also called double displacement reaction.

- Q. Write balanced chemical equations for the following reactions.
- (i) Silver bromide on exposure to sunlight decomposes into silver and bromine,
- (ii) Sodium metal reacts with water to form sodium hydroxide and hydrogen gas.

Answer.

(i)
$$2AgBr(s) \xrightarrow{Sunlight} 2Ag(s) + Br_2(g)$$

(ii)
$$2Na(s) + 2H_2O(l) \longrightarrow 2NaOH(aq) + H_2(g)$$

- Q. Identify the type of reaction(s) in the following equations.
- $(i)CH_4 + 2O_2 CO_2 + 2 H_2O$
- (ii) $Pb(NO_3)2 + 2KI --->Pbl_2 + 2KNOs$
- (iii) $CaO + H_2O ---> Ca(OH)_2$
- (iv) CuSO₄ + Zn ---> ZnSO₄ + Cu

Answer.

- (i) Combustion reaction and oxidation reaction.
- (ii)Double displacement reaction and precipitation reaction.
- (iii) Combination reaction.
- (iv) Displacement reaction.
- Q. Write balanced equation for the reaction between magnesium and hydrochloric acid. Name the product obtained, identify the type of reaction.

Answer.

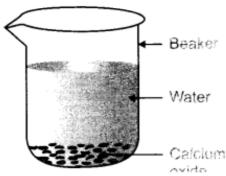

$$Mg(s) + 2HCl(dil.) \longrightarrow MgCl_2(aq) + H_2(g)$$

The product formed is magnesium chloride and hydrogen gas. It is a displacement reaction.

Q. Describe an activity to observe what happens when quick lime is added to water taken in a beaker. State two important observations and name the type of reaction taking place.

Answer.

Aim: To observe what happens when quicklime is added to water taken in a beaker. Materials Required:- Quicklime (calcium oxide), water, beaker.

Formation of slaked lime by the reaction of quicklime with water

Procedure:

- 1. Take 5 g of calcium oxide in a beaker.
- 2. Add water to it slowly.
- 3. Touch the beaker.
- 4. Note down the observations.

Observation: Calcium oxide reacts with water

vigorously to form calcium hydroxide with the evolution of heat.

Chemical Reaction:

$$CaO(s) + H_2O(l) \longrightarrow Ca(OH)_2(aq) + Heat$$

Quicklime Water Slaked lime

Conclusion: The reaction between CaO (Calcium oxide) and H_2O is a combination reaction. It is an exothermic process because heat is evolved.

Q. What is the colour of ferrous sulphate crystals? How does this colour change after heating?

Answer. The colour of ferrous sulphate is pale green. The colour changes to reddish brown on heating due to formation of iron (III) oxide.

Give an example each for thermal decomposition and photochemical decomposition reactions. Write relevant balanced chemical equations also.

Thermal decomposition reaction:

$$CuCO_3(s) \xrightarrow{Heat} CuO(s) + CO_2(g)$$
Copper carbonate Copper oxide
(Green) (Black)

Photochemical decomposition reaction:

$$2AgCl(s) \xrightarrow{Sunlight} 2Ag(s) + Cl_2(g)$$

Q. Why does the colour of copper sulphate solution change when an iron nail is dipped in it? Write two observations.

Answer. It is because displacement reaction takes place.

Iron displaces copper from copper sulphate solution and forms pale green coloured solution of FeS04 and reddish brown copper metal gets deposited.

$$Fe(s) + CuSO_4(aq) ---> FeSO_4(aq) + Cu(s)$$

Q. Translate the following statement into chemical equation and then balance it Barium chloride reacts with aluminium sulphate to give aluminium chloride and a precipitate of barium sulphate. State the two types in which this reaction can be classified.

Answer. $3\text{BaCl}_2(aq) + \text{A1}_2(S0_4)_3(aq) \longrightarrow 3\text{BaS0}_4(s) + 2\text{AlCl}_3(aq)$ It can be classified as double displacement as well as precipitation reaction.

Q. Why are decomposition reactions called the opposite of combination reactions? Write equations for these reactions.

Answer. In decomposition reaction, a compound is broken down into simpler compounds or elements, e.g.

$$CuCO_3(s) \xrightarrow{heat} CuO(s) + CO_2(g)$$

Combination reaction is a reaction in which two or more elements or compounds combine to form a new compound, e.g.

$$N_2(g) + 3H_2(g) \longrightarrow 2NH_3(g)$$

Thus, decomposition and combination reactions are opposite to each other.

- Q. Using a suitable chemical equation, justify that some chemical reactions are determined by:
- (i) change in colour, (ii) change in temperature.

Answer.

(i)
$$Pb(NO_3)_2(aq) + 2KI(aq) \longrightarrow PbI_2(s) + 2KNO_3(aq)$$

Colourless Colourless Yellow ppt.

(ii)
$$CaO(s) + H_2O(l) \longrightarrow Ca(OH)_2 + heat$$

- Q. (a) A solution of substance 'X' is used for white washing. What is the substance 'X'? State the chemical reaction of 'X' with water.
- (b) Why does the colour of copper sulphate solution change when an iron nail is dipped in it?

Answer.

(a) 'X' is calcium oxide (CaO).

$$CaO(s) + H_2O(l) --> Ca(OH)_2(aq) + heat$$

(a) It is because iron displaces copper from CuSO₄ to form FeSO₄ which is pale green.

$$Fe(s) + CUSO4 (aq) --> FeSO4(aq) + Cu(s)$$

Q. Balance the following chemical equations.

(i)
$$BaCl_9 + H_2 O_4 \longrightarrow BaSO_4 + HCl$$

$$(ii)$$
 Ca(OH)₂ + HNO₃ \longrightarrow Ca(NO₃)₂ + H₂O

$$(iii)$$
 Pb(NO₃)₂ \longrightarrow PbO + NO₂ + O₂

$$(iv)$$
 MnO₂ + HCl \longrightarrow MnCl₂ + H₂O + Cl₂

$$(i)$$
 BaCl₂ + H₂SO₄ \longrightarrow BaSO₄ + 2HCl

$$(ii)$$
 Ca(OH)₂ + 2HNO₃ \longrightarrow Ca(NO₃)₂ + 2H₂O

$$(iii)$$
 2Pb(NO₃)₂ \longrightarrow 2PbO + 4NO₂ + O₂

(iv)
$$MnO_2 + 4HCl \longrightarrow MnCl_2 + 2H_2O + Cl_2$$

- Q. Write the balanced equation for the. following reaction and identify the type of reaction in each case.
- (i) Potassium bromide + Barium iodide--> Potassium iodide + Barium bromide.
- (ii) Hydrogen(g) + Chlorine(g)--> Hydrogen chloride(g)

Answer.

(i)
$$2KBr(aq) + BaI_2(aq) \longrightarrow 2KI(aq) + BaBr_2(aq)$$

(ii)
$$H_2(g) + Cl_2(g) \longrightarrow 2HCl(g)$$

- Q. A zinc plate was put into a solution of copper sulphate kept in a glass container. It was found that blue colour of the solution gets fader and fader with the passage of time. After few days, when zinc plate was taken out of the solution, a number of holes were observed on it.
- (i) State the reason for changes observed on the zinc plate.
- (ii) Write the chemical equation for the reaction involved.

Answer.

(i) It is because zinc has displaced copper from CuS04. Zinc metal has been used to form zinc sulphate, therefore, number of holes were observed.

(ii)
$$\operatorname{Zn}(s) + \operatorname{CuSO}_4(aq) \longrightarrow \operatorname{ZnSO}_4(aq) + \operatorname{Cu}(s)$$

Blue Colourless

- Q. A white salt on heating decomposes to give brown fumes and a residue is left behind.
- (i) Name the salt.
- (ii) Write the equation for the decom-position reaction.

Answer.

(i) Lead nitrate is white salt.

(ii)
$$2Pb(NO_3)_2(s) \xrightarrow{heat} 2PbO(s) + 4NO_2(g) + O_2(g)$$

- Q. When a solution of potassium iodide is added to a solution of lead nitrate in a test tube, a reaction takes place.
- (a) What type of reaction is this?
- (b) Write a balanced chemical equation to represent the above reaction.

Answer.

(a) Double displacement as well as precipitation reaction.

(a) Double displacement as well as precipitation reaction.

(b)
$$Pb(NO_3)_2(aq) + 2KI(aq) \longrightarrow PbI_2(s) + 2KNO_3(aq)$$

Yellow ppt.

Q. Define combination reaction. Give one example of a combination reaction which is also exothermic.

Answer. A reaction in which two elements or compounds combine to form a single compound is called combination reaction.

$$CaO(s) + H_2O(l) \longrightarrow Ca(OH)_2(aq) + heat$$

It is also an exothermic reaction along with a combination reaction because heat is evolved. Short Answer Type Questions[II] [3 Marks]

Q. (a) Classify the following reactions into different types.

(i)
$$AgNO_3(aq) + NaCl(aq) \longrightarrow AgCl(s) + NaNO_3(aq)$$

(ii)
$$CaO(s) + H_2O(l) \longrightarrow Ca(OH)_2(aq)$$

(iii)
$$2KClO_3(s) \xrightarrow{\Delta} 2KCl(aq) + 3O_2(g)$$

(b) Which of the above reaction(s) is/are precipitation reaction(s)? Why is a reaction called precipitation reaction?

Answer.

- (a) (i) Precipitation reaction (Double displacement reaction)
- (ii) Combination reaction (in) Decomposition reaction
- (b) Reaction (i) is a precipitation reaction because one of the product formed is insoluble in water.

Q. Write balanced equations for the following mentioning the type of reaction involved.

- (i) Aluminium + Bromine --> Aluminium bromide
- (ii) Calcium carbonate—-> Calcium oxide + Carbon dioxide
- (iii) Silver chloride—->Silver + Chlorine

Answer.

(i)
$$2Al(s) + 3Br_2(g) \longrightarrow 2AlBr_3(s)$$

(ii)
$$CaCO_3(s) \longrightarrow CaO(s) + CO_2(g)$$

(iii)
$$2AgCl(s) \xrightarrow{Sunlight} 2Ag(s) + Cl_2(g)$$

Q. (a) Why is respiration considered as an exothermic reaction?

- (b) Define the terms oxidation and reduction.
- (c) Identify the substance that is oxidised and reduced in the following reaction.

$$CuO(s) + Zn(s) \longrightarrow Cu(s) + ZnO(s)$$

Answer. (a) It is because heat is evolved during respiration.

- (b) Oxidation is a process in which O_2 is added or H_2 is removed or loss of electrons take place. Reduction is a process in which H_2 is added or O_2 . is removed or gain of electrons take place.
- (c) Zn is getting oxidised, CuO is getting reduced.

- Q. What is meant by
- (i) precipitation reaction,
- (ii) exothermic reaction,
- (iii) oxidation reaction?

Write balanced chemical equations for an example of each.

Answer. (i) Precipitation reaction: The reaction in which two compounds exchange their ions and the product formed is insoluble in water is called precipitation reaction.

$$AgNO_3(aq) + KI(aq) \longrightarrow AgI(s) + KNO_3(aq)$$

(ii) Exothermic reaction: The reaction in Which heat is evolved is known as exothermic reaction.

$$C + O_9 \longrightarrow CO_9 + heat$$

(iii) Oxidation reaction: The reaction in which Og is added or H_2 is removed or loss of electrons takes place is called oxidation reaction.

$$2Cu + O_2 \longrightarrow 2CuO$$

- Q. You might have noted that when copper powder is heated in a china dish, the surface of copper powder becomes coated with a black colour substance.
- (i) How has this black coloured substance formed?
- (ii) What is that black substance?
- (iii) Write the chemical equation of the reaction that takes place.

Answer.

- (i) Copper reacts with oxygen to form copper oxide which is black, i.e. oxidation of copper takes place.
- (ii)Copper oxide

(iii)
$$2Cu(s) + O_9(g) \longrightarrow 2CuO(s)$$

Q. What happens when an aqueous solution of sodium sulphate reacts with an aqueous solution of barium chloride? State the physical conditions of reactants in which the reaction between them will not take place. Write the balanced chemical equation for the reaction and name the type of reaction.

Answer. White precipitate of barium sulphate is formed.

If both reactants are in solid state, then the reaction will not take place between them.

$$BaCl_2(aq) + Na_2SO_4(aq) \longrightarrow BaSO_4(s) + 2NaCl(aq)$$

It is a double displacement as well as a precipitation reaction.

Q. What is a redox reaction? When a magnesium ribbon burns in air with a dazzling flame and forms a white ash, is magnesium oxidised or reduced? Why? Answer. The reactions in which oxidation (loss of electrons) and reduction (gain of electrons) take place simultaneously are called redox reactions.

$$2Mg(s) + O_2(g) \longrightarrow 2MgO(s)$$

Magnesium Oxygen Magnesium oxide

Magnesium is getting oxidised because it is losing electrons to form Mg2+ and oxygen is gaining electrons to form O2-, therefore it is getting reduced.

Q. Write any two observations in an activity which may suggest that a chemical reaction has taken place. Give an example in support of your answer.

Answer. Any two of these observations will suggest chemical reaction has taken place.

- (i) Change in state.
- (ii)Change in colour.
- (iii) Evolution of gas.
- (iv)Change in temperature.

For example, lead nitrate is white crystalline solid which on heating gives yellowish brown solid (lead monoxide). A brown gas and a colourless gas is also evolved. It shows chemical reaction has taken place.

- Q. When the powder of a common metal is heated in an open china dish, its colour turns black. However, when hydrogen is passed over the hot black substance so formed, it regains its original colour. Based on the above information, answer the following questions.
- (i) What type of chemical reaction takes place in each of the two given steps?
- (ii) Name the metal initially taken in the powder form. Write balanced chemical equations for both reactions.

Answer.

- (i) In first step, oxidation takes place. In second step, redox reaction takes place.
- (ii) Metal in the powder form is copper.

$$2Cu(s) + O_2(g) \longrightarrow 2CuO(s)$$

 $CuO(s) + H_2(g) \xrightarrow{heat} Cu(s) + H_2O(g)$

Q. Name the products formed on strongly heating ferrous sulphate crystals. What type of chemical reaction occurs in this change?

Answer.

It is decomposition reaction.

Q. What is an oxidation reaction? Give an example of oxidation reaction. Is oxidation an exothermic or an endothermic reaction?

Answer. The reaction in which oxygen or electronegative element is added or hydrogen or electropositive element is removed or loss of electrons takes place, is called an oxidation reaction, e.g. ,

$$Fe^{2+} \rightarrow Fe^{3+} + e^{-}$$
 (loss of electron)
C + O₂ \rightarrow CO₂ + Heat

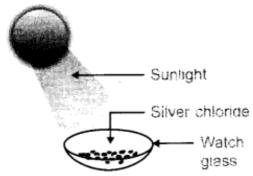

Oxidation reactions are mostly exothermic in nature because heat is evolved in this process.

Q. Describe an activity to demonstrate the change that takes place when white silver chloride is kept in sunlight. State the type of chemical reaction which takes place.

Answer.

Aim: To demonstrate the change that takes place when white silver chloride is kept in sunlight.

Materials Required: AgNO₃(aq), NaCl(aq), test tubes.

Photochemical decomposition of silver chloride to grey silver metal

Procedure:

- 1. Take 5 ml of silver nitrate solution in a test tube.
- 2. Prepare sodium chloride solution in another test tube.
- 3. Add sodium chloride solution into test tube containing silver nitrate solution.
- 4. Observe the colour of silver chloride formed chloride to grey silver metal Dry it with the help of filter papers and place it on the watch glass.
- 5. Place the watch glass under sunlight for sometime.
- 6. Observe the colour of the silver chloride after sometime. Observation: White silver chloride turns grey in sunlight because silver metal is formed.

Chemical Reaction:
$$2AgCl(s) \xrightarrow{Sunlight} 2Ag(s) + Cl_2(g)$$

Silver chloride Silver Chlorine

Explanation: Silver chloride is photosensitive. It decomposes in presence of sunlight to form silver metal and chlorine gas.

Conclusion: Decomposition of silver chloride in presence of sunlight is photochemical decomposition reaction.

63. When magnesium ribbon burns in air or oxygen, a product is formed. State the type of chemical reaction and name the product formed in the reaction. Write balanced chemical equation of this reaction.

Answer.

$$2Mg(s) + O_2(g) \xrightarrow{\text{burning}} 2MgO(s)$$

The type of reaction is combination reaction and the product formed is magnesium oxide.

Q. Distinguish between a displacement reaction and a double displacement reaction. Identify the displacement and the double displacement reaction from the following reactions.

Answer.

(i)
$$HCl(aq) + NaOH(aq) \rightarrow NaCl(aq) + H_2O(l)$$

(ii)
$$Fe(s) + CuSO_4(aq) \rightarrow FeSO_4(aq) + Cu(s)$$

Displacement reaction is a reaction in which more reactive metal can displace less reactive metal from its salt solution.

Double displacement reaction are those reactions in which compounds exchange their ions to form two new compounds (?) Double displacement reaction (ii) Displacement reaction

- 65. When you have mixed the solutions of lead(II) nitrate and potassium iodide,
- (i) what was the colour of the precipitate formed and can you name the precipitate?
- (ii) write the balanced chemical equation for this reaction.
- (iii) is this also a double displacement reaction?

Answer.

- (i) The colour of the precipitate is yellow. The name of compound formed as a precipitate is Pbl2 (lead iodide).
- (ii) $Pb(NO_3)_2(aq) + 2KI(aq) \rightarrow PbI_2(s) + 2KNO_3(aq)$
- (iii) Yes, it is also a double displacement reaction.

66. What do you mean by exothermic and endothermic reactions? Give examples.

Answer. Exothermic reactions are those in which heat is evolved, e.g.

$$C(s) + O_2(g) \longrightarrow CO_2(g) + heat$$

$$CH_4(g) + 2O_2(g) \longrightarrow CO_2(g) + 2H_2O(l) + heat$$

Endothermic reactions are those reactions in which heat is absorbed, e.g.

$$CaCO_3(s) \xrightarrow{heat} C_7O(s) + CO_2(g)$$

$$N_2(g) + O_2(g) \xrightarrow{\text{heat}} 2NO(g)$$

Short Answer Type Questions [3 Marks]

- Q. A Name the type of chemical reaction represented by the following equation:
 - (i) CaO + H₂O \longrightarrow Ca(OH)₂

$$(ii)$$
 3BaCl₂ + Al₂(SO₄)₃ \longrightarrow 3BaSO₄ + 2AlCl₃

(iii)
$$2\text{FeSO}_4 \xrightarrow{\text{heat}} \text{Fe}_2\text{O}_3 + \text{SO}_2 + \text{SO}_3$$

Answer.

- (i) Combination reaction
- (ii) Double displacement reaction (Precipitation reaction)
- (iii) Decomposition reaction.

- Q. Write the chemical equation of the reaction in which the following changes have taken place with an example of each:
- (i) Change in colour
- (ii) Change in temperature
- (iii) Formation of precipitate

(i)Cu (s) +
$$2AgNO_3$$
 (aq)——-> $Cu(NO_3)_2(aq) + 2Ag$

The solution will become blue in colour and shiny silver metal will be deposited.

(ii) NaOH + HCl
$$---->$$
 NaCl + H₂O+ heat

The temperature will increase because heat will be evolved.

(iii)
$$Pb(NO_3)2$$
 (aq) + $2KI$ (aq) ----> Pbl_2 (s) + $2KNO_3$ (aq)

Yellow ppt

Yellow precipitate of Pbl₂will be formed.

- Q. State the type of chemical reactions and chemical equations that take place in the following:
- (i) Magnesium wire is burnt in air.
- (ii) Electric current is passed through water.
- (iii) Ammonia and hydrogen chloride gases'are mixed.

Answer.

(i)
$$2Mg(s) + O_2(g) \longrightarrow 2MgO(s)$$

Combination reaction (Redox reaction).

(ii)
$$2H_2O(l) \xrightarrow{\text{electrolysis}} 2H_2(g) + O_2(g)$$

Electrical decomposition reaction.

(iii)
$$NH_3(g) + HCl(g) \longrightarrow NH_4Cl(s)$$

Combination reaction.

 $\mathbf{Q}.$ (a) Write the essential condition for the following reaction to take place:

$$2AgBr--> 2Ag + Br_2$$

Write one application of this reaction.

(b) Complete the following chemical equation of a chemical reaction 2FeS04 —

$$2\text{FeSO}_4 \xrightarrow{\text{heat}} \text{Fe}_2\text{O}_3 + \dots + \dots$$

(c) What happens when water is added to quick line. Write chemical equation.

Answer.

(a)
$$2AgBr \xrightarrow{Sunlight} 2Ag + Br_2$$

This reaction is used in photography.

(b)
$$2\text{FeSO}_4 \xrightarrow{\text{heat}} \text{Fe}_2\text{O}_3 + \text{SO}_2 + \text{SO}_3$$

- (c) Slaked lime is formed with hissing sound and lot of heat is envolved.
- Q. 2g of ferrous sulphate crystals are heated in a dry boiling tube.
- (i) List any two observations.
- (ii) Name the type of chemical reaction taking place.
- (iii) 'Write the chemical equation for the reaction.

- (i) •Green colour of Fe SO₄ disappears and reddish brown solid is formed.
- Smell of burning sulphur.
- (ii) Decomposition reaction

(iii)
$$2\text{FeSO}_4$$
 (s) $\xrightarrow{\text{heat}}$ Fe_2O_3 (s) $+$ SO_2 (g) $+$ SO_3 (g)

- Q. Write chemical equation reactions taking place when carried out with the help of
- (a) Iron reacts with steam
- (b) Magnesium reacts with dil HCl
- (c) Copper is heated in air.

Answer.

(a)
$$3\text{Fe }(s) + 4\text{H}_2\text{O}(g) \longrightarrow \text{Fe}_3\text{O}_4(s) + 4\text{H}_2(g)$$

(b)
$$Mg + 2HCl \longrightarrow MgCl_2 + H_2$$

(c)
$$2Cu + O_2 \xrightarrow{heat} 2CuO$$
 (s)

Q. Which products will be obtained when lead nitrate is heated simply. Write balanced chemical equation for the reaction? State the type of chemical reaction that occur in the change.

Answer. Lead monoxide, nitrogen dioxide and oxygen gas will be liberated.

$$2Pb(NO_3)_2$$
 (s) $\xrightarrow{\text{heat}}$ $2PbO$ (s) $+$ $4NO_2$ (g) $+$ O_2 (g)

It is thermal decomposition reaction.

Q. What is meant by skeltal type chemical equation? What does it represent? Using the equation for electrolytic decomposition of water, differentiate between a skeltal chemical equation and a balanced chemical equation.

Answer. The equations in which gaseous are written in atomic form instead of molecular form and equation is not balanced, are called skeltal type equation. They represent gaseous elements formed in atomic state and equation is not balanced

$$H_2O \xrightarrow{\text{electrolysis}} H + O \text{ (Skeltal equation)}$$

Hydrogen and oxygen are written in atomic forms and equation is not balanced.

$$H_2O \longrightarrow H_2 + O_2$$
 is also skeltal equation.

$$2H_2O \longrightarrow 2H_2 + O_2$$
 (Balanced chemical equation)

27. The following diagram displays a chemical reaction. Observe carefully and answer the following questions

(a) Identify the type of chemical reaction that will take place and define it. How will the

colour of the salt change?

Write the chemical equation of the reaction that takes place.

(c) Mention one commercial use of this salt.

Answer. (a) Photochemical decomposition reaction: Those reactions in which a compound breaks down into simple substances in presence of light are called photochemical decomposition reaction. The colour of salt will change from white to grey.

(b)
$$2AgCl(s) \xrightarrow{Sunlight} 2Ag(s) + Cl_2(g)$$

(c) Silver chloride is used in photography.

Q. What is rancidity? Mention any two ways by which rancidity can be prevented.

Answer. The process in which taste and smell of food gets spoiled is called rancidity. It happens due to oxidation.

Prevention from rancidity:

- (i) Antioxidants are added to fatty acids to prevent oxidation, e.g. chips are packed in presence of nitrogen gas which prevents spoilage by oxidation.
- (ii)Food should be kept in airtight container in refrigerator.
- Q. Write balanced chemical equation for the reactions that take place during respiration. Identify the type of combination reaction that takes place during this process and justify the name. Give one more example of this type of reaction.

Answer.
$$CgH_{12}O_6 + 6O_2 ----> 6CO_2 + 6H_2O + heat$$

It is an exothermic combination reaction because heat is evolved.

$$CH_4(g) + 2O_2(g) ----> CO_2(g) + 2H_20$$

Combustion of methane is another example of exothermic combination reaction.

Q. What is redox reaction? Identify the substance oxidised and the substance reduced in the following reactions.

$$(i)$$
2PbO + C --> 2Pb + CO₂

$$(ii)MnO_2 + 4HCI --> MnCl_2 + 2H_2O + Cl_2$$

Answer. Those reactions in which oxidation and reduction takes place simultaneously are called redox reactions.

- (i) PbO is getting reduced and C is getting oxidised.
- (ii) MnOs is getting reduced and HCl is getting oxidised.
- Q. Write the balanced chemical equations for the following reactions and identify the type of reaction in each case.

Thermite reaction, iron (III) oxide reacts with aluminium and gives molten iron and aluminium oxide.

Answer.

$$Fe_2O_3(s) + 2Al(s) \longrightarrow Al_2O_3(s) + 2Fe(l) + heat$$

Iron (III) Aluminium Aluminium Molten iron oxide oxide

It is a displacement reaction because A1 is displacing Fe from Fe_2O_3 . Molten iron is used'for repairing broken railway tracks.

Q. A solution of potassium chloride when mixed with silver nitrate solution, an insoluble white substance is formed. Write the chemical reaction involved and also mention the type of the chemical reaction?

Answer.

$$KCl(aq)$$
 + $AgNO_3(aq)$ \longrightarrow $AgCl(s)$ + $KNO_3(aq)$
Potassium Silver Silver chloride Potassium chloride nitrate (White ppt.)

It is a double displacement reaction. It is also a precipitation reaction as AgCl is a white precipitate.

Long Answer Type Questions [5 Marks]

- Q. (a) Define a balanced chemical equation. Why should an equation be balanced? (b) Write the balanced chemical equation for the following reaction:
- (i) Phosphorus burns in presence of chlorine to form phosphorus penta chloride.
- (ii) Burning of natural gas.
- (iii) The process of respiration.

Answer.

(a) Balanced chemical equation has an equal number of atoms of different elements in the reactants and products. According to law of conservation of mass, matter can neither be created nor be destroyed in a chemical reaction.

(b)(i)
$$P_4$$
 (s) + $10Cl_2$ (g) $---> 4PCl_5$ (S)

(i)CH₄ (g) +
$$2O_2$$
 (g) $---> CO_2$ (g) + $2H_2O(I)$ + heat energy

(iii)
$$C_6H_{12}O_6$$
 (s) + $6O_2$ (g) + $6H_{20}$ ---> $6CO_2$ (aq) + $12H_2O$ (l) + energy

- Q. (a) Explain two ways by which food industries prevent rancidity.
- (b) Discuss the importance of decomposition reaction in metal industry with three points.

Answer.

- (a) (i) Rancidity can be prevented by adding antioxidants to food containing fat and oil, e.g. butylated hydroxy anisole is added to butter as antioxidant.
- (ii) It can be prevented by packaging fat and oil containing foods in nitrogen gas.
- (b) (i) Molten NaCl is electrolytically decomposed to form sodium metal.
- (ii) Aluminium metal is obtained by electric decomposition of bauxite ore mixed with cryolite.
- (iii) Carbonate ores are thermally decomposed to give metal oxide which on reduction give metal.
- Q. (a) Write one example for each of decomposion reaction carried out with help of
- (i) Electricity (ii) Heat (iii) Light
- (b) Which of the following statements is correct and why copper can displace silver from silver nitrate and silver can displace copper from copper sulphate solution.

(a) (i)
$$2H_2O \xrightarrow{\text{electricity}} 2H_2(g) + O_2$$

(ii)
$$CaCO_3 \xrightarrow{heat} CaO + CO_2$$

(iii)
$$2AgBr \xrightarrow{Sunlight} 2Ag + Br_2$$

(b) Copper can displace silver from ${\rm AgNO_3}$ because copper is more reactive than ${\rm Ag}$

$$Cu + 2AgNO_3 (aq) \longrightarrow Cu(NO_3)_2 (aq) + 2Ag (s)$$
