(A) Main Concepts and Results

- The meaning of a tangent and its point of contact on a circle.
- Tangent is perpendicular to the radius through the point of contact.
- Only two tangents can be drawn to a circle from an external point.
- Lengths of tangents from an external point to a circle are equal.

(B) Multiple Choice Questions

Choose the correct answer from the given four options:

Sample Question 1: If angle between two radii of a circle is 130°, the angle between the tangents at the ends of the radii is:

(A) 90°

(B) 50°

(C) 70°

(D) 40°

Solution: Answer (B)

Sample Question 2: In Fig. 9.1, the pair of tangents AP and AQ drawn from an external point A to a circle with centre O are perpendicular to each other and length of each tangent is 5 cm. Then the radius of the circle is

(A) 10 cm

(B) 7.5 cm

(C) 5 cm

(D) 2.5 cm

Solution: Answer (C)

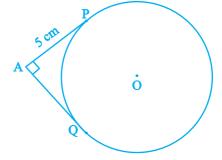

Fig. 9.1

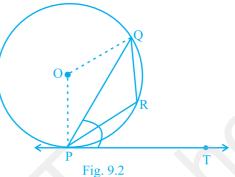

Sample Question 3: In Fig. 9.2, PQ is a chord of a circle and PT is the tangent at P such that $\angle QPT = 60^{\circ}$. Then $\angle PRQ$ is equal

- (A) 135°
- (B) 150°
- (C) 120°
- (D) 110°

Solution: Answer (C)

[Hint:
$$\angle OPQ = \angle OQP = 30^{\circ}$$
, i.e., $\angle POQ$

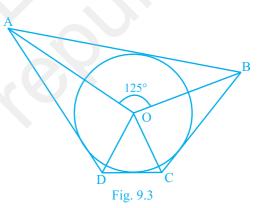

= 120°. Also,
$$\angle PRQ = \frac{1}{2} \text{ reflex } \angle POQ$$
]

EXERCISE 9.1

Choose the correct answer from the given four options:

- 1. If radii of two concentric circles are 4 cm and 5 cm, then the length of each chord of one circle which is tangent to the other circle is
 - (A) 3 cm
- (B) 6 cm
- (C) 9 cm
- (D) 1 cm
- In Fig. 9.3, if $\angle AOB = 125^{\circ}$ 2. then ∠COD is equal to
 - (A) 62.5°
- (B) 45°
- (C) 35°
- (D) 55°
- In Fig. 9.4, AB is a chord of the 3. circle and AOC is its diameter such that $\angle ACB = 50^{\circ}$. If AT is the tangent to the circle at the point A, then ∠BAT is equal to
 - (A) 65°
- (B) 60°
- (C) 50°
- (D) 40°

50° O

Fig. 9.4

- 4. From a point P which is at a distance of 13 cm from the centre O of a circle of radius 5 cm, the pair of tangents PQ and PR to the circle are drawn. Then the area of the quadrilateral PQOR is
 - (A) 60 cm²
- (B) 65 cm²
- (C) 30 cm²
- (D) 32.5 cm²
- 5. At one end A of a diameter AB of a circle of radius 5 cm, tangent XAY is drawn to the circle. The length of the chord CD parallel to XY and at a distance 8 cm from A is
 - (A) 4 cm
- (B) 5 cm
- (C) 6 cm
- (D) 8 cm
- **6.** In Fig. 9.5, AT is a tangent to the circle with centre O such that OT = 4 cm and $\angle OTA = 30^{\circ}$. Then AT is equal to
 - (A) 4 cm
- (B) 2 cm
- (C) $2\sqrt{3}$ cm (D) $4\sqrt{3}$ cm

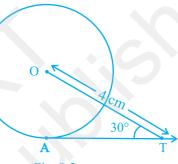

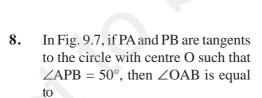

Fig. 9.5

- 7. In Fig. 9.6, if O is the centre of a circle, PQ is a chord and the tangent PR at P makes an angle of 50° with PQ, then ∠POQ is equal to
 - (A) 100°
- 809
- (C) 90°
- 75°

- (A) 25°
- 30° (B)
- (C) 40°
- (D) 50°

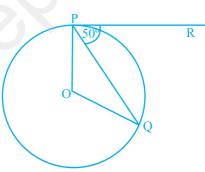

Fig. 9.6

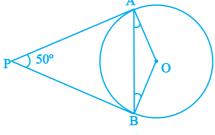

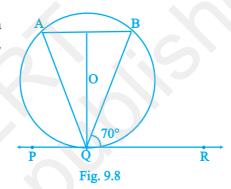

Fig. 9.7

- 9. If two tangents inclined at an angle 60° are drawn to a circle of radius 3 cm, then length of each tangent is equal to
 - (A) $\frac{3}{2}\sqrt{3}$ cm
- (B) 6 cm
- (C) 3 cm
- (D) $3\sqrt{3}$ cm
- 10. In Fig. 9.8, if PQR is the tangent to a circle at Q whose centre is O, AB is a chord parallel to PR and \angle BQR = 70°, then \angle AQB is equal to
 - (A) 20°
- (B) 40°
- (C) 35°
- (D) 45°

(C) Short Answer Questions with Reasoning

Write 'True' or 'False' and give reasons for your answer.

Sample Question 1 : In Fig. 9.9, BOA is a diameter of a circle and the tangent at a point P meets BA extended at T. If \angle PBO = 30°, then \angle PTA is equal to 30°.

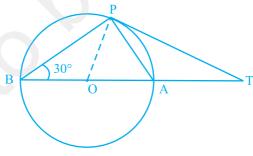

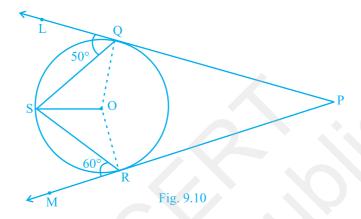

Fig. 9.9

Solution : True. As \angle BPA = 90°, \angle PAB = \angle OPA = 60°. Also, OP \perp PT. Therefore, \angle APT = 30° and \angle PTA = 60° - 30° = 30°.

Sample Question 2 : In Fig. 9.10, PQL and PRM are tangents to the circle with centre O at the points Q and R, respectively and S is a point on the circle such that \angle SQL = 50° and \angle SRM = 60°. Then \angle QSR is equal to 40°.

Solution : False. Here $\angle OSQ = \angle OQS = 90^{\circ} - 50^{\circ} = 40^{\circ}$ and $\angle RSO = \angle SRO = 90^{\circ} - 60^{\circ} = 30^{\circ}$. Therefore, $\angle QSR = 40^{\circ} + 30^{\circ} = 70^{\circ}$.

EXERCISE 9.2

Write 'True' or 'False' and justify your answer in each of the following:

- 1. If a chord AB subtends an angle of 60° at the centre of a circle, then angle between the tangents at A and B is also 60° .
- 2. The length of tangent from an external point on a circle is always greater than the radius of the circle.
- **3.** The length of tangent from an external point P on a circle with centre O is always less than OP.
- **4.** The angle between two tangents to a circle may be 0° .
- 5. If angle between two tangents drawn from a point P to a circle of radius a and centre O is 90°, then OP = $a\sqrt{2}$.
- 6. If angle between two tangents drawn from a point P to a circle of radius a and centre O is 60° , then OP = $a\sqrt{3}$.
- 7. The tangent to the circumcircle of an isosceles triangle ABC at A, in which AB = AC, is parallel to BC.

- **8.** If a number of circles touch a given line segment PQ at a point A, then their centres lie on the perpendicular bisector of PQ.
- **9.** If a number of circles pass through the end points P and Q of a line segment PQ, then their centres lie on the perpendicular bisector of PQ.
- 10. AB is a diameter of a circle and AC is its chord such that $\angle BAC = 30^{\circ}$. If the tangent at C intersects AB extended at D, then BC = BD.

(D) Short Answer Questions

Sample Question 1: If d_1 , d_2 ($d_2 > d_1$) be the diameters of two concentric circles and c be the length of a chord of a circle which is tangent to the other circle, prove that $d_2^2 = c^2 + d_1^2$.

Solution : Let AB be a chord of a circle which touches the other circle at C. Then \triangle OCB is right triangle (see Fig.9.11). By Pythagoras theorem $OC^2 + CB^2 = OB^2$.

i.e.,
$$\frac{1}{2}d_1^2$$
 $\frac{1}{2}c^2$ $\frac{1}{2}d_2$

(As C bisects AB)

Therefore, $d_2^2 = c^2 + d_1^2$.

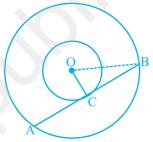

Fig. 9.11

Sample Question 2: If a, b, c are the sides of a right triangle where c is the hypotenuse, prove that the radius r of the circle which touches the sides of the triangle is given by

$$r = \frac{a + b + c}{2}$$
.

Solution : Let the circle touches the sides BC, CA, AB of the right triangle ABC at D, E and F respectively, where BC = a, CA = b and AB = c (see Fig. 9.12). Then AE = AF and BD = BF. Also CE = CD = r.

i.e.,
$$b-r = AF$$
, $a-r = BF$
or $AB = c = AF + BF = b-r+a-r$

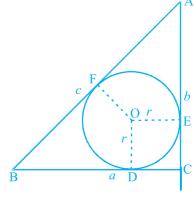

Fig. 9.12

This gives
$$r = \frac{a + b + c}{2}$$

EXERCISE 9.3

- 1. Out of the two concentric circles, the radius of the outer circle is 5 cm and the chord AC of length 8 cm is a tangent to the inner circle. Find the radius of the inner circle.
- **2.** Two tangents PQ and PR are drawn from an external point to a circle with centre O. Prove that QORP is a cyclic quadrilateral.
- 3. If from an external point B of a circle with centre O, two tangents BC and BD are drawn such that $\angle DBC = 120^{\circ}$, prove that BC + BD = BO, i.e., BO = 2BC.
- **4.** Prove that the centre of a circle touching two intersecting lines lies on the angle bisector of the lines.
- 5. In Fig. 9.13, AB and CD are common tangents to two circles of unequal radii. Prove that AB = CD.
- 6. In Question 5 above, if radii of the two circles are equal, prove that AB = CD.
- 7. In Fig. 9.14, common tangents AB and CD to two circles intersect at E. Prove that AB = CD.
- 8. A chord PQ of a circle is parallel to the tangent drawn at a point R of the circle. Prove that R bisects the arc PRQ.

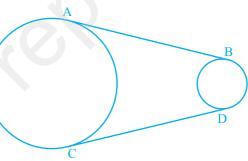

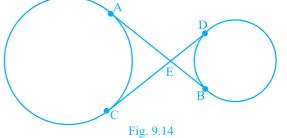

Fig. 9.13

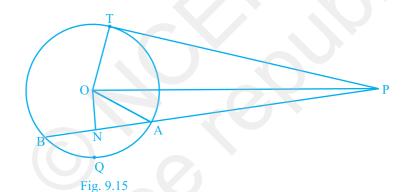

9. Prove that the tangents drawn at the ends of a chord of a circle make equal angles with the chord.

10. Prove that a diameter AB of a circle bisects all those chords which are parallel to the tangent at the point A.

(E) Long Answer Questions

Sample Question 1: In Fig. 9.15, from an external point P, a tangent PT and a line segment PAB is drawn to a circle with centre O. ON is perpendicular on the chord AB. Prove that:

- (i) $PA \cdot PB = PN^2 AN^2$
- (ii) $PN^2 AN^2 = OP^2 OT^2$
- (iii) $PA.PB = PT^2$

Solution:

(i)
$$PA \cdot PB = (PN - AN) (PN + BN)$$

$$= (PN - AN) (PN + AN) \qquad (As AN = BN)$$

$$= PN^2 - AN^2$$

(ii)
$$PN^2 - AN^2 = (OP^2 - ON^2) - AN^2$$
 (As $ON \perp PN$)
 $= OP^2 - (ON^2 + AN^2)$
 $= OP^2 - OA^2$ (As $ON \perp AN$)
 $= OP^2 - OT^2$ (As $OA = OT$)

(iii) From (i) and (ii)
$$PA.PB = OP^{2} - OT^{2}$$

$$= PT^{2} \qquad (As \angle OTP = 90^{\circ})$$

Sample Question 2 : If a circle touches the side BC of a triangle ABC at P and extended sides AB and AC at Q and R, respectively, prove that $AQ = \frac{1}{2} (BC + CA + AB)$

Solution: See Fig. 9.16.

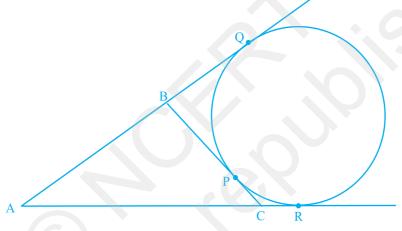

Fig. 9.16

By Theorem 10.2 of the textbook,

$$BQ = BP$$

$$CP = CR, and$$

$$AQ = AR$$

$$2AQ = AQ + AR$$

$$= (AB + BQ) + (AC + CR)$$

$$= AB + BP + AC + CP$$

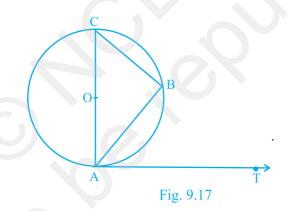

$$= (BP + CP) + AC + AB$$

$$= BC + CA + AB$$
i.e.,
$$AQ = \frac{1}{2} (BC + CA + AB).$$

EXERCISE 9.4

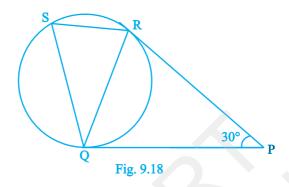

- 1. If a hexagon ABCDEF circumscribe a circle, prove that AB + CD + EF = BC + DE + FA.
- 2. Let s denote the semi-perimeter of a triangle ABC in which BC = a, CA = b, AB = c. If a circle touches the sides BC, CA, AB at D, E, F, respectively, prove that BD = s b.
- **3.** From an external point P, two tangents, PA and PB are drawn to a circle with centre O. At one point E on the circle tangent is drawn which intersects PA and PB at C and D, respectively. If PA = 10 cm, find the perimeter of the triangle PCD.
- **4.** If AB is a chord of a circle with centre O, AOC is a diameter and AT is the tangent at A as shown in Fig. 9.17. Prove that

$$\angle BAT = \angle ACB$$

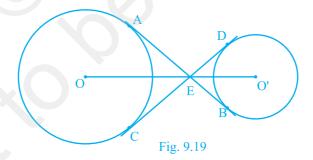

- 5. Two circles with centres O and O' of radii 3 cm and 4 cm, respectively intersect at two points P and Q such that OP and OP are tangents to the two circles. Find the length of the common chord PQ.
- 6. In a right triangle ABC in which $\angle B = 90^{\circ}$, a circle is drawn with AB as diameter intersecting the hypotenuse AC and P. Prove that the tangent to the circle at P bisects BC.
- 7. In Fig. 9.18, tangents PQ and PR are drawn to a circle such that \angle RPQ = 30°. A chord RS is drawn parallel to the tangent PQ. Find the \angle RQS.

[Hint: Draw a line through Q and perpendicular to QP.]

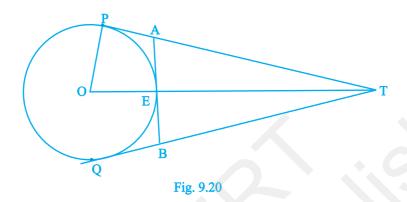

- 8. AB is a diameter and AC is a chord of a circle with centre O such that $\angle BAC = 30^{\circ}$. The tangent at C intersects extended AB at a point D. Prove that BC = BD.
- **9.** Prove that the tangent drawn at the mid-point of an arc of a circle is parallel to the chord joining the end points of the arc.
- **10.** In Fig. 9.19, the common tangent, AB and CD to two circles with centres O and O' intersect at E. Prove that the points O, E, O' are collinear.

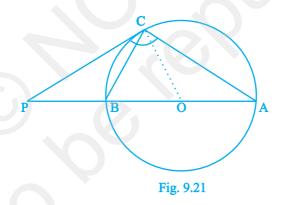

11. In Fig. 9.20. O is the centre of a circle of radius 5 cm, T is a point such that OT = 13 cm and OT intersects the circle at E. If AB is the tangent to the circle at E, find the length of AB.

112 EXEMPLAR PROBLEMS

12. The tangent at a point C of a circle and a diameter AB when extended intersect at P. If $\angle PCA = 110^{\circ}$, find CBA [see Fig. 9.21].

[Hint: Join C with centre O.]

- 13. If an isosceles triangle ABC, in which AB = AC = 6 cm, is inscribed in a circle of radius 9 cm, find the area of the triangle.
- A is a point at a distance 13 cm from the centre O of a circle of radius 5 cm. AP and AQ are the tangents to the circle at P and Q. If a tangent BC is drawn at a point R lying on the minor arc PQ to intersect AP at B and AQ at C, find the perimeter of the ΔABC.
