# UNIT - IV PLANTS AND HUMAN WELFARE

## 4.1. CROP IMPROVEMENT

## SYNOPSIS

- The process of bringing wild species under human management is referred to as domestication.
- Plant breeding began when man first chose certain plants for cultivation.
- Plant breeding developed as a science only after the rediscovery of Mendel's laws of heredity.
- Application of knowledge acquired in the fields of molecular genetics & cytogenetics helped breeders to achieve wonderful results in a short time.

#### **Aims and Objectives**

- Incorporation of as many desirable qualities as possible into a single variety, so as to make it superior to the existing varieities is the main objective of plant breeding.
  - 1. To increase the yield of grains, fodder, fibre, oil and other plant products.
  - 2. To improve the quality of crops with regard to size, colour, shape, taste, nutritional value, storage ability of grains, vegetables, fruits etc. and many special qualities like high sugar content in sugar crops, high protein content in pulses, long and fine fibres in fibre crops, large size fruits in fruit crops etc.
  - 3. To develop varieties that are resistant to diseases, insects, drought, frost, floods, alkaline and saline conditions.
  - 4. To produce early maturing varieties for crop rotation purposes.
  - 5. To change the growth habits and agronomic characteristics of plants and to produce dwarf varieties, plants with profuse branching or more tillering, tolerance to moisture stress and salts.
  - 6. Suitability for easy harvesting, adaptability to wide regions are some of the other objectives.

## • Methods of Plant breeding

The methods of plant breeding are dependent on the type of reproduction and pollination mechanisms in plants. Different methods of plant breeding are

A) Plant introduction

B) SelectionD) Mutation breeding

C) Hybridization E) Polyploidy breeding

#### **Plant Introduction**

Plant introduction is a process of introducing plants into a new locality with different climate from their natural growing places.

- 1. It is the simplest & easiest method. No scientific knowledge is necessary and only some amount of skill is required.
- 2. Introduced varieties can be directly used in agriculture & horticulture.
- 3. They serve as germplasm banks for crop improvement.

The sum total of genes in a plant species is referred to as germ plasm.

The germ plasm is stored in the form of seeds, pollen etc.

## • Achievements

Ex: Sonora 63,64, varieties of wheat from Mexico. I R 8 variety of rice from philippines.

#### Selection

## Selection is the basis for crop improvement

#### Mass selection

This is the oldest known method of selection and is useful in cross pollinated crops.

Mass selection is utilised to improve the yield and quality of the crop.

Best results are obtained based on the heterozygosity within the crop varieties.

About 8 years time is taken for production of a variety by this method.

#### • Advantages

- 1. It is the easiest method of selection. No scientific knowledge is required except some amount of skill. It is, therefore, said that the mass selection is more of an art than a science.
- 2. This is the only method of selection in wild or local crop varieties of cross pollinated plants.

#### • Achievements

Many of the existing crops are products of mass selection only. They are

- a) Cotton : Many of the Indian commercial varieties like Dharwar American, Dodahattilocal, Cambodias etc.
- b) Bajra : Pusa Moti.

## • Pure-line selection

The progeny of a single, self-pollinated, homozygous plant is known as 'pure line. The method of production of a variety from the pure line is known as "**Pure line selection**".

**W.L Johannsen**, a Denmark scientist proposed pure line selection method for crop improvement. He conducted selection experiments on 'princess variety' of bean (*Phaseolus vulgaris*) This method is employed only for **self-pollinated crops**. By this process for about **10 years**, a new variety is produced.

## • Advantages

- 1. It is the only method to improve the local varieties of self-pollinated crops.
- 2. Pure line selection increases homozygosity and consequently all the progeny developed by this method are phenotypically and genotypically uniform
- Achievements : Some examples of crop plants developed through pure line selection are
  - a) Groundnut : TMV 3 and RSB 17
  - **b) Rice** : CO 4, 6, 10, 14 varieties

• Clonal selection

A group of plants obtained vegetatively from a single plant is known as 'clone' and the method of developing varieties from the clones is known as 'clonal selection'.

All the plants in a clone are phenotypically and genotypically similar. Like pure line selection, their characters remain constant.

However, in the vegetatively propagated plant, the characters are in heterozygous state, and they remain the same throughout the breeding.

Many vegetative parts such as setts (sugarcane), cuttings (roses), tubers (Potato), bulbs (onion), suckers (banana) etc. are the units of clonal selection. Selection is effective when it is **between clones but not within a clone**, because all the individuals within a clone have the same genotype.

Selection within a clone seems to be effective only when a mutation intervenes.

Generally, it takes **nine years** to produce superior variety.

#### • Advantages

The progeny of clonal selection remain stable for any number of generations. If they possess hybrid vigour, the character can be exploited for many generations.

#### • Achievement

Many crop plants have been developed through clonal selection. Some examples are

a) Potato : Kufri red and kufri safed varieties.b) Mango : Mundapa pedda neelam.

## • Hybridization

Hybridization is the **most important method** of plant breeding. Either in introduction or in selection there is no scope of incorporating new desired characters, but it is possible through hybridization. **Hybridization can be defined as the method** of producing new crop varieties by crossing two genetically different parents. The plant breeder always aims to incorporate as many desirable qualities from various varieties into a single variety.

In nature, cross pollination occurs in many plants leading to hybridization.

In hybridization genetic recombination occurs.

Hence great amount of genetic variability results in the offspring, which are utilized for crop improvement.

## • Hybridization procedure

Crossing two plants of different genotypes involves the following procedure.

• Selection of parents : The foremost aspect of hybridization is to select homozygous plants with desirable characters as parents.

Heterozygous plants can be converted into homozygous plants by repeated selfing (inbreeding).

• Emasculation : Removal of anthers from bisexual flowers of female parents, when the flowers are still in bud condition is c a l l e d 'emasculation'.

It prevents self pollination.

In case of large flower buds, emasculation is easily performed by opening the flower buds by means of sterilized forceps and fine needle and then removing anthers without causing injury to other floral parts.

In case of small flowers, which are crowded in dense inflorescences as in bajra, jowar etc. the whole inflorescence is dipped in hot water at  $45-50^{\circ}C$ 

or different periods of 1-10 minutes.

The gynoecium can withstand higher temperatures but anthers get killed.

Some plants are male sterile, i.e., in them although bisexual flowers have stamens, they do not possess active and fertile pollen.

Male sterile plants can be used directly as female parents without emasculation.

• **Bagging :** After emasculation is done, the female flower is enclosed in a polythene bag to prevent any other pollen grains falling on the stigmatic surface. Thus bagging prevents the undesired cross pollination.

Thus bagging prevents the undestred cross pollination.

• Artificial cross pollination : Pollen grains are collected from the male parent with the help of a brush or blotting paper and these are transferred carefully to the surface of the stigma and thus cross pollination is affected artificially.

The flowers are immediately enclosed in polythene bags.

Seeds and fruits are formed after fertilization.

Self pollination occurs in  $F_1$  plants and plants of

 $F_2$  generation develop.

The plants possessing desirable characters are selected and developed by different methods. Seeds are multiplied and finally released to farmers for cultivation.

• Advantages : New genetic recombinations can be created by hybridization. Many hybrids exhibit hybrid vigour. A large number of desirable characters can be incorporated into a single variety.

## • Hybrid vigour or Heterosis

The  $F_1$  hybrids, as a rule in majority of the cases are more vigorous (taller, sturdier and more productive) than the parents.

> The superiority of the hybrids over the parents in terms of size and vigour is known as hybrid vigour or **heterosis**

Although **Koelreuter** identified hybrid vigour, he could not understand the reasons. **G.H. Shull** an American Scientist introduced the term 'Heterosis'.

He found that in maize, constant self pollination (inbreeding) produced a considerable loss of vigour (inbreeding depression) and when the weak progenies were crossed, the resulting hybrids exhibited the hybrid vigour.

Hybrid vigour is caused due to the presence of **more number of dominant genes** in a hybrid than its parents or due to its **heterozygosity** unlike its parents.

## • Mutation breeding

Mutations are sudden heritable changes in the genotype of an organism.

**Hugo de Vries** for the first time used the term 'mutation' for the appearance of new types in the evening primrose plant (Oenothera).

## Induction of desirable mutations in plants and their utilization for the production of new superior varieties is called 'Mutation breeding'.

It is an efficient method of plant breeding. The ingenious experiments of **Muller** and **Stadler** laid the foundation for Mutation breeding. According to their origin, mutations are classified into two types.

i. Spontaneous Mutations ii. Induced Mutations

## • Spontaneous mutations

These mutations arise automatically in nature. Their frequency is extremely low.

They are caused due to the action of naturally occurring aspects like electric currents, atomic rays and particles, temperature variations etc. *Oenothera gigas* (large sized plants) and *O. nanella* (dwarf plants) are few examples of spontaneous mutations.

## • Induced mutations

**H.J. Muller** induced mutations in *Drosophila* for the first time using X-rays, while **L.J. Stadler** induced mutations in barley in 1928.

Genetic variations required for crop improvement are induced in large numbers in relatively short period. Substances which induce mutations are called **'mutagens'**.

These are of two types.

- 1. Physical mutagens and
- 2. Chemical mutagens

All ionizing radiations (X-rays,  $\alpha$  -rays,  $\beta$  -rays,  $\gamma$  -rays) and non-ionizing radiations like ultraviolet rays are powerful physical mutagens.

The seeds, seedlings, buds and flowers are subjected to irradiation leading to the production of large number of mutations.

Chemical mutagens are colchicine, formaldehyde, ethyl methane sulphonate (EMS),malic hydrazide etc. Mostly they cause gene mutations.

Mutation breeding is a quick method to induce genetic variability in many crops.

## • Achievements

- a) By mutation breeding, disease resistance is incorporated into IR-8 rice
- b) The sweedish variety of barley with hardinessc) Aruna variety of castor

## • Polyploidy breeding

In nature, sexually reproducing organisms are in diploid condition. In them two sets of chromosomes are present.

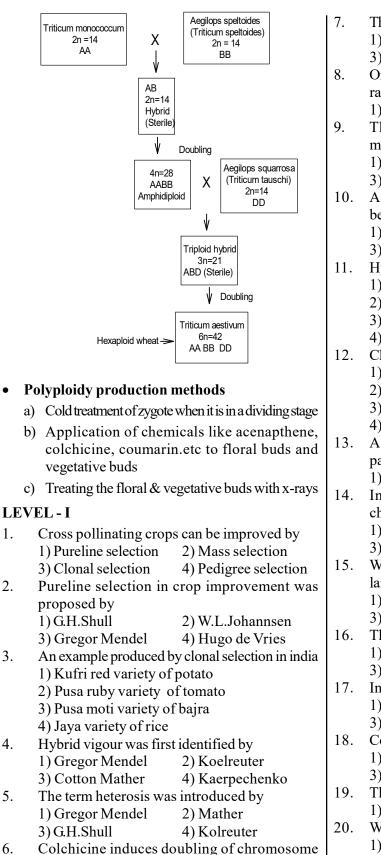

However, many plants, especially grasses are either triploids (3x), tetraploids (4x), hexaploids (6x) or octaploids (8x).

Such plants having more than two sets of chromosomes are termed as **polyploids.** 

The utilization of polyploidy for the improvement of crops is called '**polyploidy breeding**'.

## • Hexaploids

The commercial bread wheat (*Triticum aestivum*) is a classic example for an allohexaploid. The origin of bread wheat is schematically described in following figure.

- Colchicine induces doubling of chromosome 6. number by
  - 1) Promoting DNA replication

1.

2.

3.

4.

5.

- 2) Promoting spindle formation
- 3) Splitting the chromosome into chromatids
- 4) Suppressing the spindle formation

| 57.  | Application of knowledge acquired in which of  |
|------|--|
|      | the following fields help breeders to achieve  |
|      | wonderful results in a short time  |
|      | I) Molecular genetics II) Cytology   |
|      | III) Cytogenetics IV) Taxonomy   |
|      | 1) I, II 2) II, IV 3) I, III 4) All  |
| Note | : For all Assertion (A) and Reason (R)   |
|      | Questions, identify the correct answer from  |
|      | the choices given below.   |
|      | 1. A and R are correct and R is the correct  |
|      | explanation of A   |
|      | 2. A and R are correct but R is not the  |
|      | correct explanation of A   |
|      | 3. A is true but R is false  |
|      | 4. A is false but R is true  |
| 58.  | Assertion (A): Cultivated crop plants are the result                                     |
|      | of domestication   |
|      | Reason (R): The process of bringing wild species   |
|      | into cultivation is referred to as domestication   |
| 59.  | Assertion (A): With the beginning of civilization  |
|      | man started domesticating plants   |
|      | Reason (R): Domestication refers to identification                                       |
|      | of plants found growing in wild places   |
| 60.  | Assertion (A): Man is mostly dependent on plants   |
|      | for his necessities.   |
|      | Reason (R): Plants are major sources of man's  |
| (1   | needs like food, fuel, medicines   |
| 61.  | Assertion (A) : Early maturing varieties are   |
|      | produced through plant breeding  |
|      | Reason (R): Early maturing variety is not useful in                                      |
| 62.  | crop rotation $A$ scarting $(A)$ : Some total of genes in a plant                        |
| 02.  | Assertion (A): Some total of genes in a plant  |
|      | species is referred to as germplasm.<br>Reason (R): The germ plasm is stored in the form |
|      | of seeds, pollen etc   |
| 63.  | Assertion (A): Introduction is the simplest and  |
| 05.  | easiest method of plant breeding   |
|      | Reason (R): No scientific knowledge is necessary   |
|      | for introducing plants   |
| 64.  | Assertion (A) : All rice varieties cultivated in our                                     |
| 0.11 | country were introduced from Philippines.  |
|      | Reason (R): I.R-8 variety of rice was introduced   |
|      | into India from Philippines.   |
| 65   | Dead the following statements and find out the   |

65. Read the following statements and find out the incorrect ones

I) Selection is oldest breeding method

II) Mass selection is oldest selection method

III) Pure line selection is one of an art more than science IV) In nature cross pollination occurs in many plants leading to hybridization

1) I & II 2) II & III 3) IV only 4) III only

| 66. | Which of the following statements is true ?<br>1) Dodahatti local of cotton is a product of selection | 75. | having mixed populations and uncontrol            |                                |  |  |
|-----|---|-----|---|--------------------------------|--|--|
|     | 2) Androecium withstands high temperature   |     | pollination is                                    |                                |  |  |
|     | 3) Self pollination increases heterozygosity  |     | 1) Mass selection                                 | 2) Pure line selection         |  |  |
|     | 4) Inbreeding depression is due to allogamy   |     | 3) Clonal selection                               | 4) Mutation breeding           |  |  |
| 67. | The development of improved varieties of  | 76. | 1 0   | hod which involves only        |  |  |
|     | economically important plants is mainly due to  |     | -   | n of best genotypes already    |  |  |
|     | 1) Judicious combination of selection, introduction   |     | present in the population                         |                                |  |  |
|     | and hybridization of different varieties  |     | 1) Introduction                                   | 2) Mutation breeding           |  |  |
|     | 2) Introduction of varieties of crops under different   |     | 3) Polyploidy breeding                            |                                |  |  |
|     | conditions  | 77. | 1   | ot one of the following are    |  |  |
|     | 3) The scientific improvement of cultivated plants  |     | true for mass selection.                          |                                |  |  |
|     | 4) Selection of seeds from healthier plants.  |     | · •   | able characters are chosen     |  |  |
| 68. | Assertion (A) : Dwarf Mexican wheat cultivar  |     | on the basis of pheno                             | • •                            |  |  |
|     | Sonara-64 was introduced in India.  |     | 2) This method is practiced for homozygous plants |                                |  |  |
|     | Reason (R) : Dwarfness increases disease  |     | which are self pollina                            |                                |  |  |

|     | 1) Sonora 64 2) IR-8  |     |   | ued upto six generations       |  |  |
|     | 3) Dodahatti local 4) Sonora -63  | -   | successively                                      |                                |  |  |
| 70. | Choose the correct statement  | 78. |   | ection is oldest method of     |  |  |
|     | 1) Homozygosity is the basis for mass selection   |     | selection.  |                                |  |  |
|     | 2) Mass selection is the easiest and fastest method   |     |   | ection is useful in cross      |  |  |
|     | of crop improvement   | 70  | pollinated crops.                                 | 1                              |  |  |
|     | 3) Varieties obtained by pureline selection show  | 79. | than science.                                     | election is more of an art     |  |  |
|     | high adaptability to wide areas   |     |   | fic knowledge is required      |  |  |
|     | 4) Hybrid vigour can be exploited for many years  |     | except some amount of s                           |                                |  |  |
|     | by pure line selection  | 80. | _   | ng is the result of pure line  |  |  |
| 71. | If a plant breeder has to evolve a disease resistant  | 00. | selection?  | ing is the result of pure line |  |  |
|     | strain, then the first step that he has to take is  |     | I. Loss of adaptability of                        | f the crop                     |  |  |
|     | 1) to start with hybridization  |     | II. Loss of heterozygosit                         | *                              |  |  |
|     | 2) to select the parents  |     |   | op in both phenotype and       |  |  |
|     | 3) to go to the field to find out such plants   |     | genotype  | op in complicitotype and       |  |  |
|     | 4) to go to the library in search of book on the subject  |     | 1) I only 2) I & II                               | 3) III only 4) I, II & III     |  |  |
| 72. | Assertion (A): Selection is the oldest breeding method  | 81. | The method of mass sel                            | · · · ·                        |  |  |
|     | Reason (R): Many of the existing crops are  |     | 1) Phenotype of the parental plants               |                                |  |  |
|     | obtained by selection   |     | 2) Phenotypes of the fem                          | -                              |  |  |
| 73. | Assertion (A): Selection is the basis for crop  |     | 3) Genotype of the male                           |                                |  |  |
|     | improvement   |     | · · ·   | type of the female parent      |  |  |
|     | Reason $(R)$ : The greater the genetic variability in   | 82. | , <b>, , ,</b>                                    | od that may cause loss of      |  |  |
|     | a population, better are the results of selection   |     | vigour if continued for lo                        | •                              |  |  |
| 74. | Which one of the following is wrong statement   |     | 1)Heterosis                                       | 2) Hybridization               |  |  |
|     | regarding the aims of plant breeding?   |     | 3) Mass selection                                 | 4) Pure line selection         |  |  |
|     | 1) To produce early maturing variety  | 83. | · ·   | Johanssen conducted            |  |  |
|     | 2) Suitability for easy harvesting  |     | experiments belongs to                            |                                |  |  |
|     | 3) Adaptability to a particular region  |     | 1)Asteraceae                                      | 2) Fabaceae                    |  |  |
|     | 4) Increase yield of crop plants  |     | 3) Solanaceae                                     | 4) Apiceae                     |  |  |
|     |   |     |   |                                |  |  |

Arrange the following steps of hybridization 84. Assertion (A): Progeny developed by pureline 95. selection are phenotypically and genotypically procedure in a sequence uniform I. Artificial cross pollination II. Selection of parents Reason (R): Pure line selection is applicable for **IV. Emasculation** III. Bagging cross pollinated crops 1) III, I, II, IV 2) II, IV, III, I 85. Assertion (A): All the progeny developed by pure 3) IV, II, I, III 4) II, I, IV, III line selection are genotypically uniform. Assertion (A): Great amount of genetic variability 96. Reason (R): Pureline selection increases results in the off spring obtained through homozygosity. hybridization 86. Assertion (A): Pure line selection is the only method Reason (R) : Recombinants are formed in to improve the local varieties of self pollinated crops hybridization leading to variability Reason (R): It takes 10 years to produce a new 97. Assertion (A): Emasculation of bisexual flowers variety through pure line selection of female parent is a pre-requisite for artificial 87. Assertion (A): Pure line selection method for crop improvement was proposed by W.L. Johannsen. crossing. Reason (R): W.L. Johannsen conducted Reason (R): There is a possibility of self pollination experiments on evening primrose in bisexual flowers, which must be avoided by the 88. The propogule in kufrired is removing of stamens. 1) Bulb 2) Cutting 3) Stem tuber 4) Ear 98. Assertion (A): Dense inflorescence of bajra, is 89. Taking it for granted that mutation has not dipped in hot water to kill the anthers, before intervened, then during clonal selection, it is always carrying out crossing, instead of using forceps advisable to do selection between the individuals Reason (R): Emasculation by forceps is difficult in of different clones, but not within a clone. The bajra as the flowers are minute logical explanation is 99. Assertion (A): Flowers of Bajra and Jowar are 1) Individuals of the same clone do not have good dipped in hot water at 45 -50°C for emasculation adaptive value Reason (R): Gynoecium can withstand higher 2) Individuals of the same clone have the same temperature than androecium genotypical constitution 3) In individuals of the same clone yield is less 100. Emasculation is not needed for 4)In individuals of the same clone hybrid vigour is less A) Bisexual Flowers B)Unisexual flowers Assertion (A): The progeny obtained by clonal 90. C) Male sterile plants selection is both phenotypically and genotypically 1) A&B 2) B&C 3) A & C 4) C alone similar. 101. Assertion (A): Emasculation is not required in male Reason (R): They are obtained through vegetative sterile plants. propagation. Reason (R): Self pollination is not possible due to Assertion (A): Clonal selection is a method of 91. the absence of fertile pollen breeding in sugar cane 102. Assertion (A) : G.H. Shull introduced the term Reason(R): Sugarcane is propagated through heterosis stolons 92. Assertion (A): Pusa Moti is a variety obtained Reason (R): He found that inbreeding in maize through clonal selection. resulted in loss of vigour Reason (R): A group of plants obtained by 103. Assertion (A): A hybrid can exhibit superiority over vegetative propagation from a single plant is called its parents in terms of size and vigour clone Reason (R) : The total number of favourable 93. Assertion (A): The progeny of clonal selection dominant genes are more in the hybrid plant than remain stable for any number of generations. its parents. Reason (R): All the individuals within a clone show 104. Assertion (A): The mutations that arise automaticsame genotype. ally in nature are described as spontaneous. Assertion (A): Emasculation is removal of male parts. 94. Reason (R): Oenothera gigas is an example of Reason (R): Bagging is not required for emasculated spontaneous mutation. flowers.

120. Select the wrong pair 2) I.R.8 -Rice 1) Aruna- Castor 3) Princess vareity - Maize 4) Sonora - Wheat 121. Find out the miss match : 2) Muller - Drosophila 1) Triticum-Aegilops 3) Shull-Heterosis 4) Charles Darwin - Artificial selection 122. Find out wrong combination : 1) CO-14 -Rice variety 2) TMV-3 -Ground nut 3) Kufri red -Bajra 4) Doda hatti local - Cotton 123. Read the following statements : Choose the true statement 1) Hybridization is easiest method of plant breeding 2) New genotypes arise during clonal selection 3) Mass selection is a science 4) Pure line selection method is more laborious than mass selection method 124. Assertion (A): In pure lines, characters remain stable for several generations. Reason (R) : Pure lines are obtained from homozygous parents by self fertilization 125. Assertion (A): Pure line selection is more of science than an art. Reason (R) : Knowledge of pollination and techniques of field designs are required for testing the progeny in pureline selection. 126. Assertion (A): There is no scope of incorporating new characters in introduction, clonal selection and pure line selection Reason (R) : New characters are incorporated through hybridization 127. The similarity between a clone and pureline is that both 1) are hybrids 2) Can be obtained by repeated crossing 3) Exhibit high degree of heterozygosity 4) Are phenotypically and genotypically uniform 128. Identify incorrect statement 1) Introduced new varieties can be directly used in agriculture and horticulture 2) Pure line selection increases homozygosity 3) Kufrired is a variety in potato 4) Many of the existing crops are the products of pure line selection 129. Assertion (A): The majority of crop plants have unisexual flowers.

Reason (R): For making crosses in normally self pollinated crops emasculation is a prerequisite

- 130. Assertion (A): Many hybrids exhibit hybrid vigour. Reason (R): Hybridization increase heterozygosity.
- 131. Identify true statement among the following :
  - 1) The Australian variety of barley with hardiness was produced through mutation breeding
  - 2) Muller and Standler laid the foundation of mutation breeding
  - 3) Constant self pollination generally leads to increase in vigour in many crop plant
  - 4) Hybrid vigour is caused due to less number dominant genes
- 132. Identify wrong statement:
  - 1) Colchicine is an alkaloid obtained from flower of colchicum
  - 2) Inbreeding refers to breeding between genetically related individuals of species by self pollination
  - 3) Progeny of single plant obtained by vegetative propagation is called clone
  - 4) Polyploids can be produced artificially through cold treatment of zygote.
- 133. Find out the incorrect statement
  - 1) Triticum aestivum is popularly known as commercial bread wheat
  - 2) Plants having more than two sets of chromosomes are called polyploids
  - 3) Oenothera nanella is dwarf variety
  - 4) Stadler induced mutation in Drosophila
- 134. Greater genetic variability can be created in the plants through
  - 1) Mass selection and clonal selection
  - 2) Pure line selection and clonal selection
  - 3) Pure line selection and mass selection
  - 4) Hybridization and mutation breeding
- 135. Identify the incorrect combination :
  - 1) Charles Darwin Natural selection
  - 2) Hugo de Vries Polyploidy breeding
  - 3) Triticum monococcum 2n=14
  - 4) Ionizing radiation Gamma rays
- 136. Identify the wrong statement
  - 1) Clonal selection is employed only for self pollination crops
  - 2) In sugarcane setts or stem cuttings are the units of clonal selections
  - The progeny obtained by pure line selection method are phenotypically and genotypically uniform
  - 4) Johannsen conducted experiment on Phaseolus vulgaris.
