

TIME, SPEED AND DISTANCES

1. Speed (s) = $\frac{\text{Distance (d)}}{\text{Time (t)}}$

2. Distance is constant

$$S \propto \frac{1}{t}$$

$$S_1 t_1 = S_2 t_2$$

Average speed :-

$$\begin{array}{ccc} x \text{ kmph} & & y \text{ kmph} \\ \xrightarrow{\quad d_1 \quad} & & \xleftarrow{\quad d_2 \quad} \end{array}$$

$$t_1 = \frac{d_1}{x}$$

$$t_2 = \frac{d_2}{y}$$

$$\text{Average Total speed} = \frac{\text{Total distance}}{\text{Total time}}$$

$$= \frac{d_1 + d_2}{t_1 + t_2}$$

$$= \frac{d_1 + d_2}{\frac{d_1}{x} + \frac{d_2}{y}}$$

$$= \frac{xy(d_1 + d_2)}{d_1 y + d_2 x}$$

$$= \frac{xy(d + d)}{dy + dx}$$

$$\therefore d_1 = d_2 = d$$

$$\boxed{\text{Average speed} = \frac{2xy}{x+y} \text{ kmph}}$$

Relative speeds :-

1. In opposite directions :-

$$\text{Relative speed} = (x+y) \text{ kmph}$$

2. In same direction :-

$$\text{Relative speed} = (y-x) \text{ kmph}$$

3. Time is constant :-

$$\begin{aligned} S &\propto d \\ S_1 d_2 &= S_2 d_1 \end{aligned}$$

4. Speed is constant :-

$$\begin{aligned} d &\propto t \\ d_1 t_2 &= d_2 t_1 \end{aligned}$$

5. Units :-

$$\begin{aligned} \text{Speed} \begin{cases} \text{kmph} = \frac{1000 \text{ m}}{60 \times 60 \text{ s}} = \frac{5}{18} \text{ m/s} \\ \text{mps} = \frac{18}{5} \text{ kmph} \end{cases} \end{aligned}$$

$$1. \text{ speed} = \frac{\text{distance}}{\text{time}}$$

$$\text{distance} = (20 \times 50) = 1000 \text{ m} = 1 \text{ km}$$

$$\text{time} = 1 \text{ min} = 1 \times \frac{1}{60} \text{ hr}$$

$$\therefore \text{ speed} = \frac{1 \text{ km}}{\frac{1}{60} \text{ hr}} = 60 \text{ km/hr}$$

$$2. S_c = \frac{d}{t}, \quad S_j = \frac{d/2}{2t}$$

$$\frac{S_j}{S_c} = \frac{d}{4t} \times \frac{t}{d} = 1:4$$
